Sound and Music Computing

L3: Introduction to Music Representation, Analysis and Transcription

Wang Ye

wangye@comp.nus.edu.sg

Office: AS6-04-08

Topics to Cover (*selective approach*)

Part A: The Core

- Introduction
- Review of DFT, Audio Representation, and Machine Learning
- Music Representation, Analysis and Transcription
- Automatic Music Transcription (AMT)
- Automatic Speech Recognition (ASR)
- Generative Models for Text-to-Speech (TTS) & Singing Voice Synthesis (SVS)

Midterm break

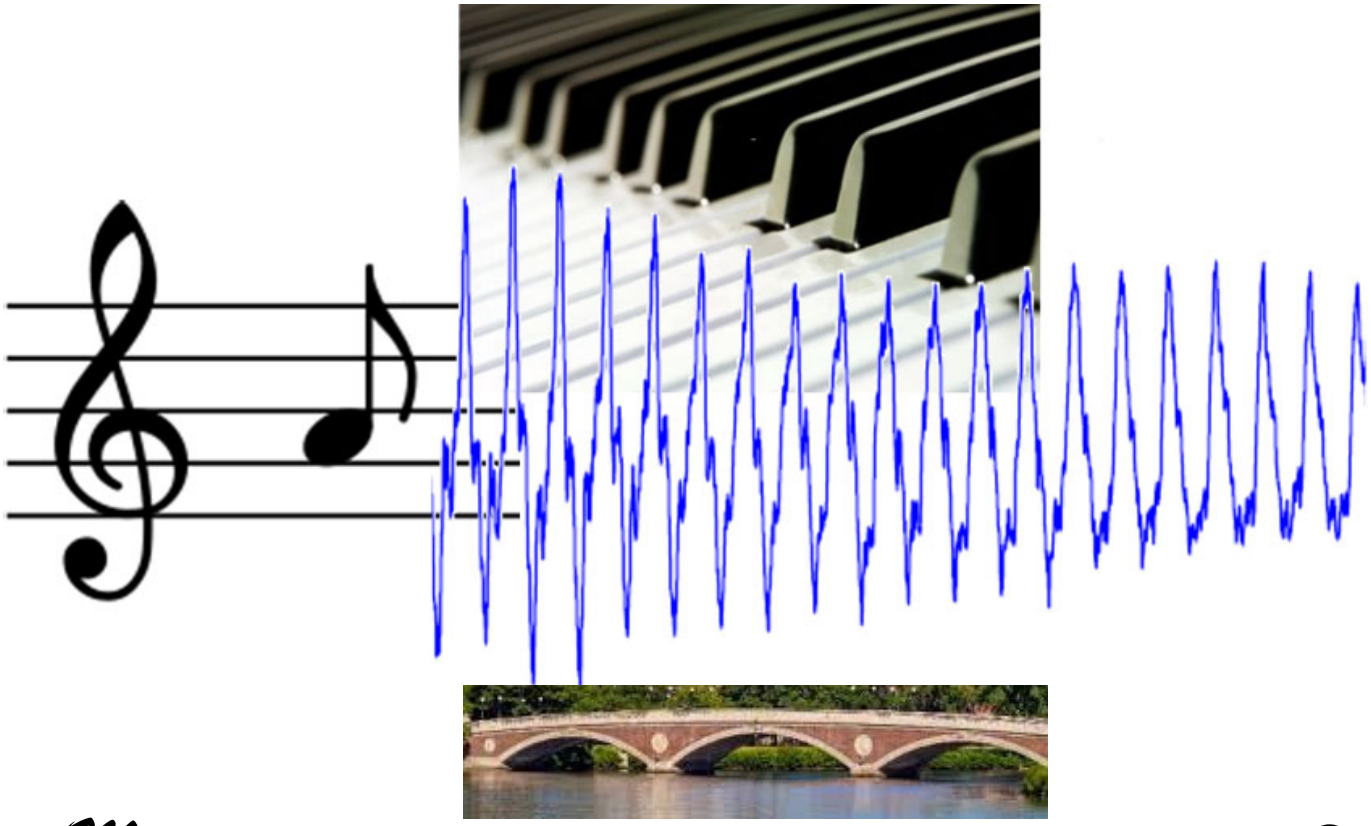
Part B: The Breadth

- Singing voice processing
- Music production audio effects
- Automatic Music Generation
- Synthesis of sound & music – a DSP approach
- Project presentations/demo

Today's topics

1) Recap what we have learnt last week
2) Music representations – music notation demystified
3) Music analysis (e.g. transcription)

Music Representations



Music — ***CS4347/CS5647*** — Computing

ASR (CS5241) AMT (CS4347)

What is music?

The Concise Oxford Dictionary defines music as "the art of combining vocal or instrumental sounds (or both) to produce beauty of form, harmony, and expression of emotion"

Why do we listen to music?

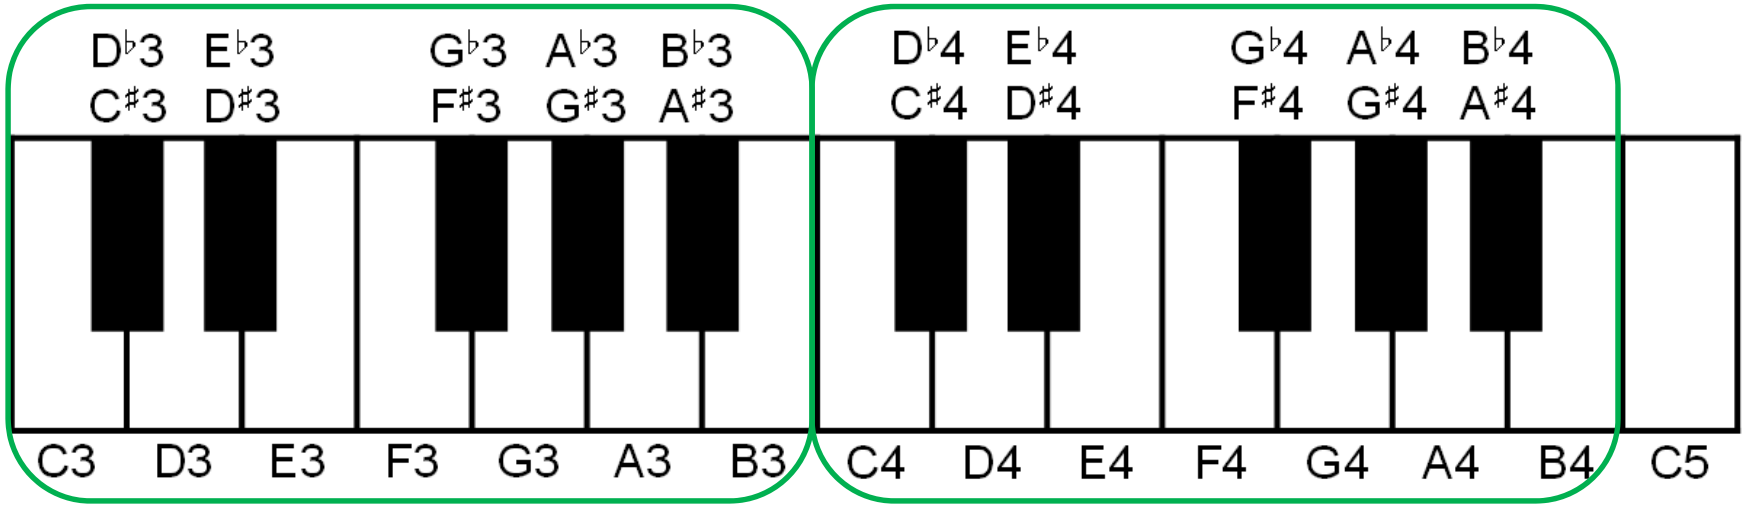
Sheet Music Representations

Textual description of music – the language of musicians!

Let's try to demystify it with the spectrogram representation!

Sheet Music Representations

Twelve-tone equal-tempered scale in western music



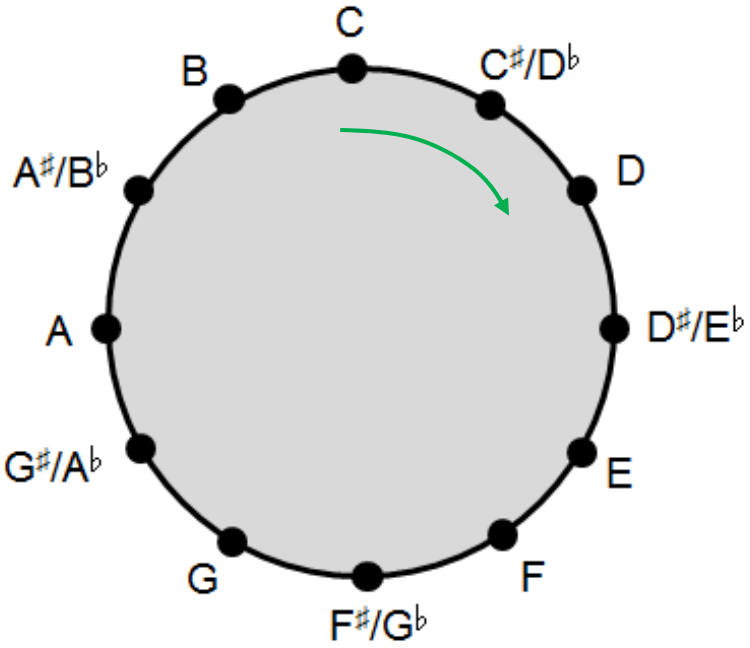
1 octave

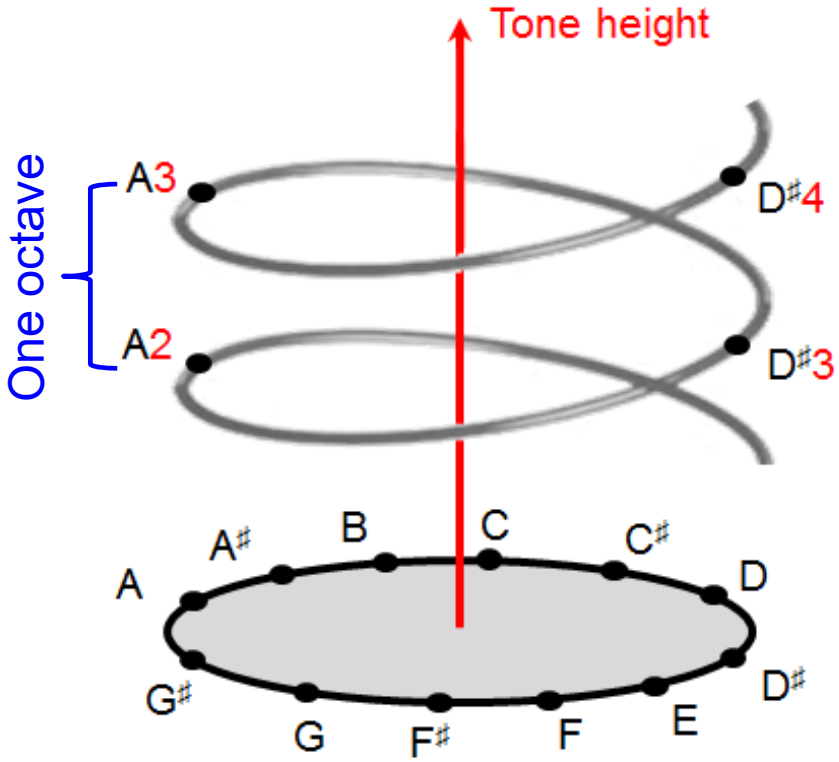
1 octave

Compare symbols in the sheet music to words and phonemes in speech!

Sheet Music Representations

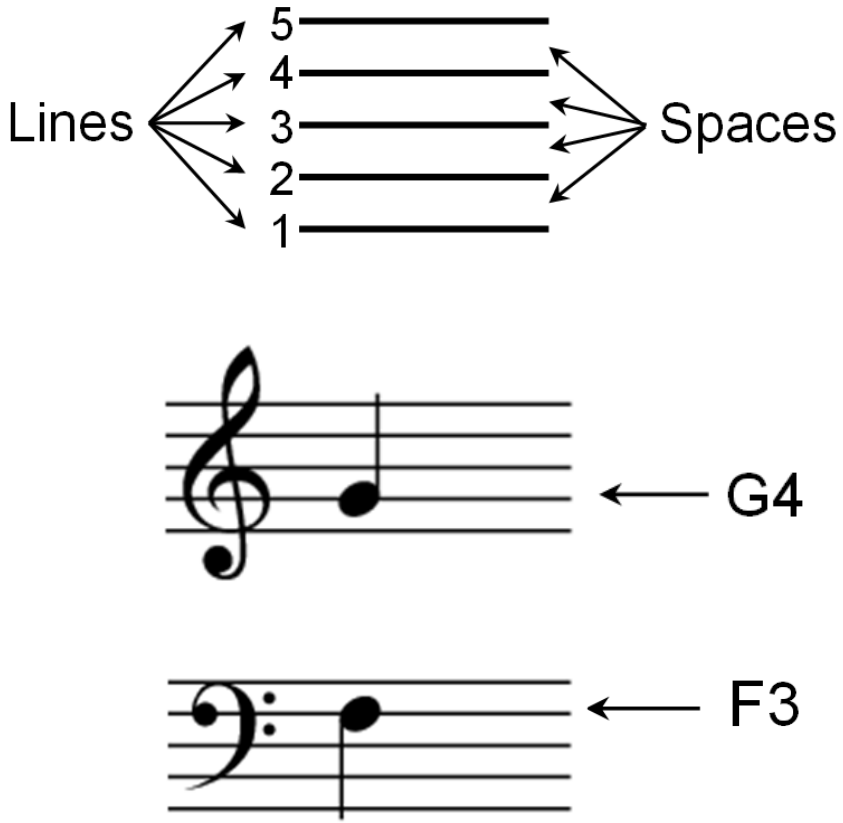
Twelve-tone equal-tempered scale in western music





Do not confuse this spiral representation with the unit circle for DFT!

Sheet Music Representations



Compare symbols in the sheet music to words and phonemes in speech!

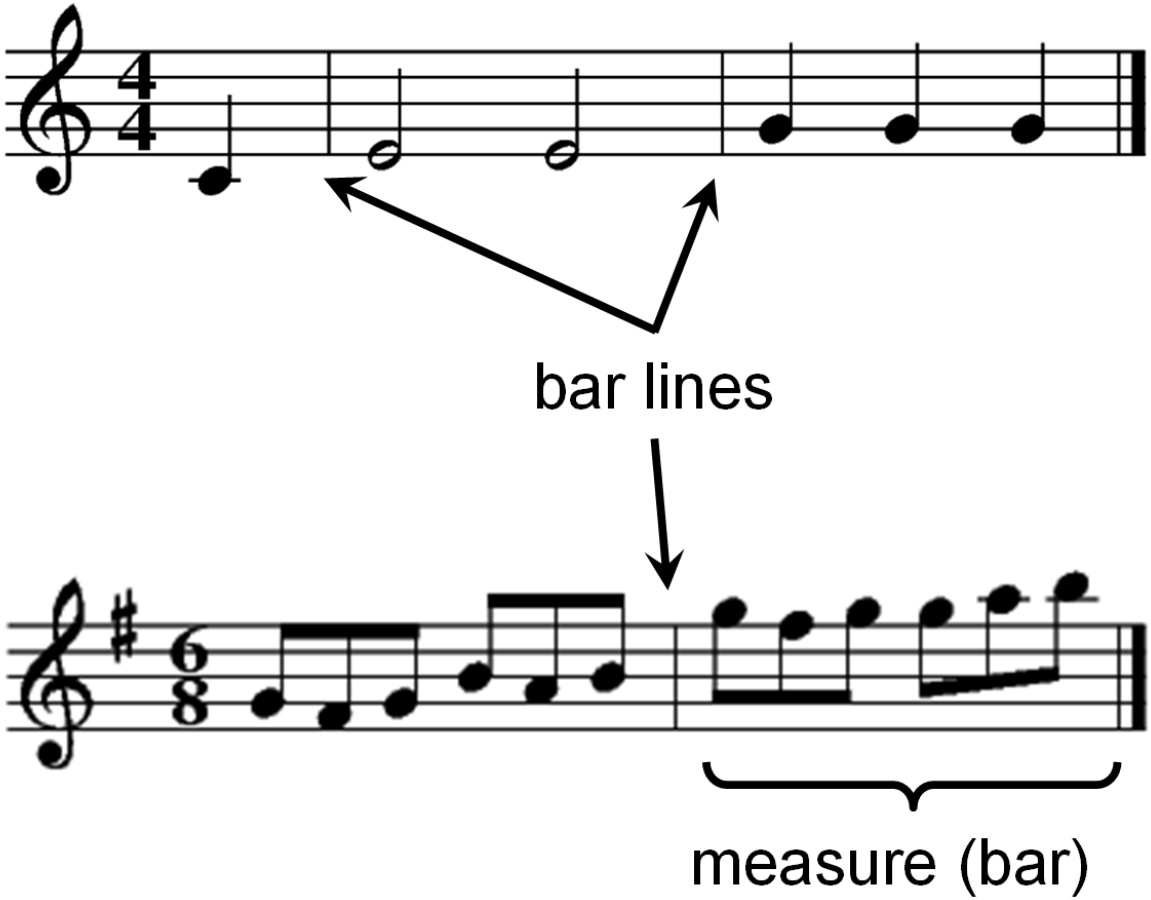
Sheet Music Representations (*pitch*)

C-major scale starting with C4 and ending with C5

Key signature consisting of three flats converting the notes into a C-Minor scale

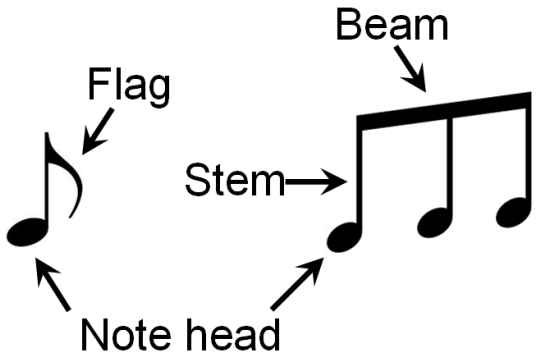
A flat (♭) lowers a note by a semitone.

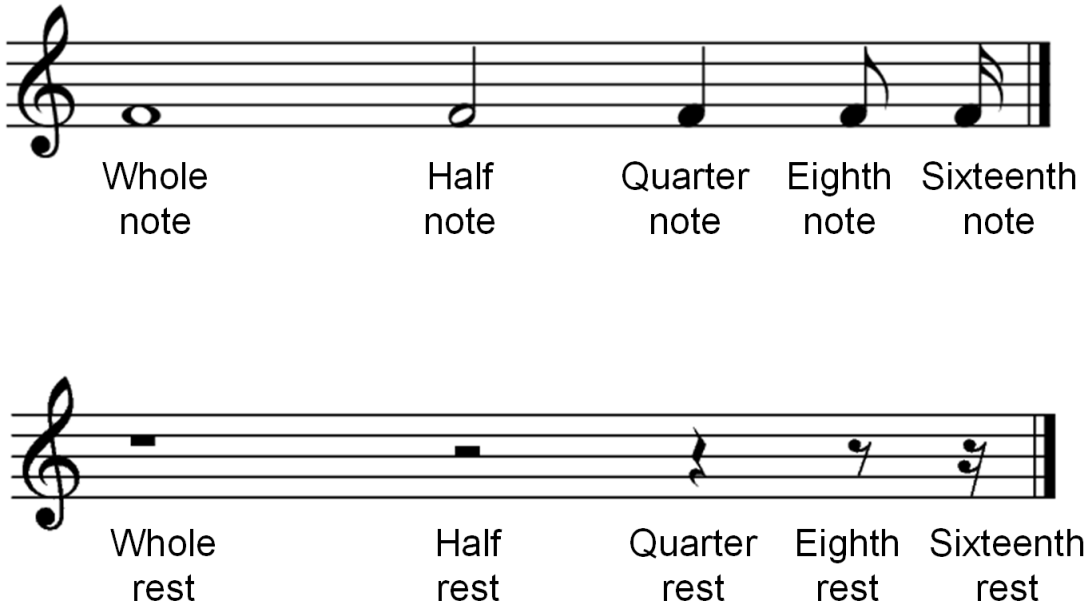
Sheet Music Representations (*time*)



Meinard Müller, Fundamentals of Music Processing
ISBN: 978-3-319-21944-8, Springer, 2015

Sheet Music Representations





Meinard Müller, Fundamentals of Music Processing
ISBN: 978-3-319-21944-8, Springer, 2015

Sheet Music Representations

A very intuitive language – a demo session by a pianist would be helpful!

Note Name (With ANSI index), Perceived Pitch (rounded to nearest Hertz) & MIDI No.

NOTE	A	A#	B	C	C#	D	D#	E	F	F#	G	G#	A	A#	B	C	C#	D	D#	C	C#	…	…

Note Name

Scales, Frequency Ratio & Cents

Given a frequency ratio r, the number of cents c is:

$c = (1200/\log_{10}(2))*\log_{10}(r))$

Given c the number of cents, to convert back to ratio r:

$r = 10^{\{c(\log10(2))/1200\}}$

Frequencies of Notes in the tempered scale

Notes naming: From Music to MIDI

- Notes of a western scale are named in ascending order from the first seven letters of the alphabet, A-G and they repeat to represent the same notes (notes of the same chroma) at higher or lower octaves.
  - e.g. 440Hz is A, 220Hz is A one octave lower

- American Standards Association extension: Number (register) appended to the note's letter name so as to associate a note to its fundamental frequency.
  - e.g 440Hz is A4, 220Hz Is A3, 880Hz is A5

- MIDI: Numbers are assigned to note pitches for ease of representation.
  - e.g. A3 is assigned 69, A4 assigned 81 (69+12 reflecting A4 as 12 semitones, 1 octave higher than A3)

- Converting fundamental frequency (f) to a MIDI note number (n) and vice versa*:

$$n = 12 \times \log_2 \left[\frac{f}{440} \right] + 69$$

$$f = 440 \times 2^{\left(\frac{n-69}{12}\right)}.$$

*Assuming equal temperament scale

Music Representations (MIDI format)

MIDI (**M**usical **I**nstrument **D**igital **I**nterface) is a technical **standard** that describes 3 components:

- Protocol
- Digital Interface
- Connectors

What is the purpose of MIDI?

- In 1970 each digital synthesizer manufacturer was creating its own system to link the input device (usually keyboard) to the sounds
- In 1983 the full MIDI 1.0 detailed specification was released

MIDI is a standardized way of communication between synthesizers, computers, samplers and other musical equipment.

What is MIDI data?

MIDI does **NOT** carry sound, it carries **event messages**.

What type of events ?

- The start of a note
- The end of a note
- Changing the parameters of the synthesizer
- Other controls and configuration messages

What is a MIDI file?

A **MIDI** recording, or **MIDI** file can be thought of as being an enhanced score:

- Exact dynamics (quantified between 0-127)
- Exact timings
- Other information (eg: sustain pedal)

A **MIDI** file does **NOT** contain the music. It contains just “instructions” to play the music, thus the file size of a MIDI recording is greatly reduced.

How can we listen to a MIDI file ?

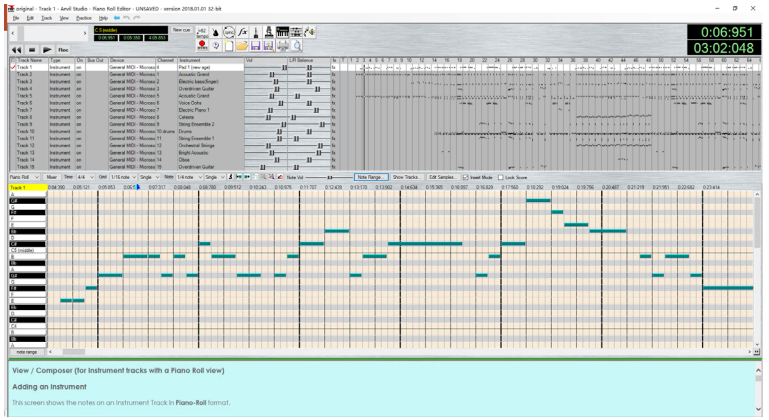
To listen to a MIDI file we need one or more pieces of software or hardware that are able to play the MIDI “instructions”:

- Synthesizers
- Samplers
- Virtual Instruments

Can you hear the difference?

Pros and Cons of MIDI

- Easy to edit
  - Change notes
  - Change tempo
  - Change instruments
  - Add tracks
  - …



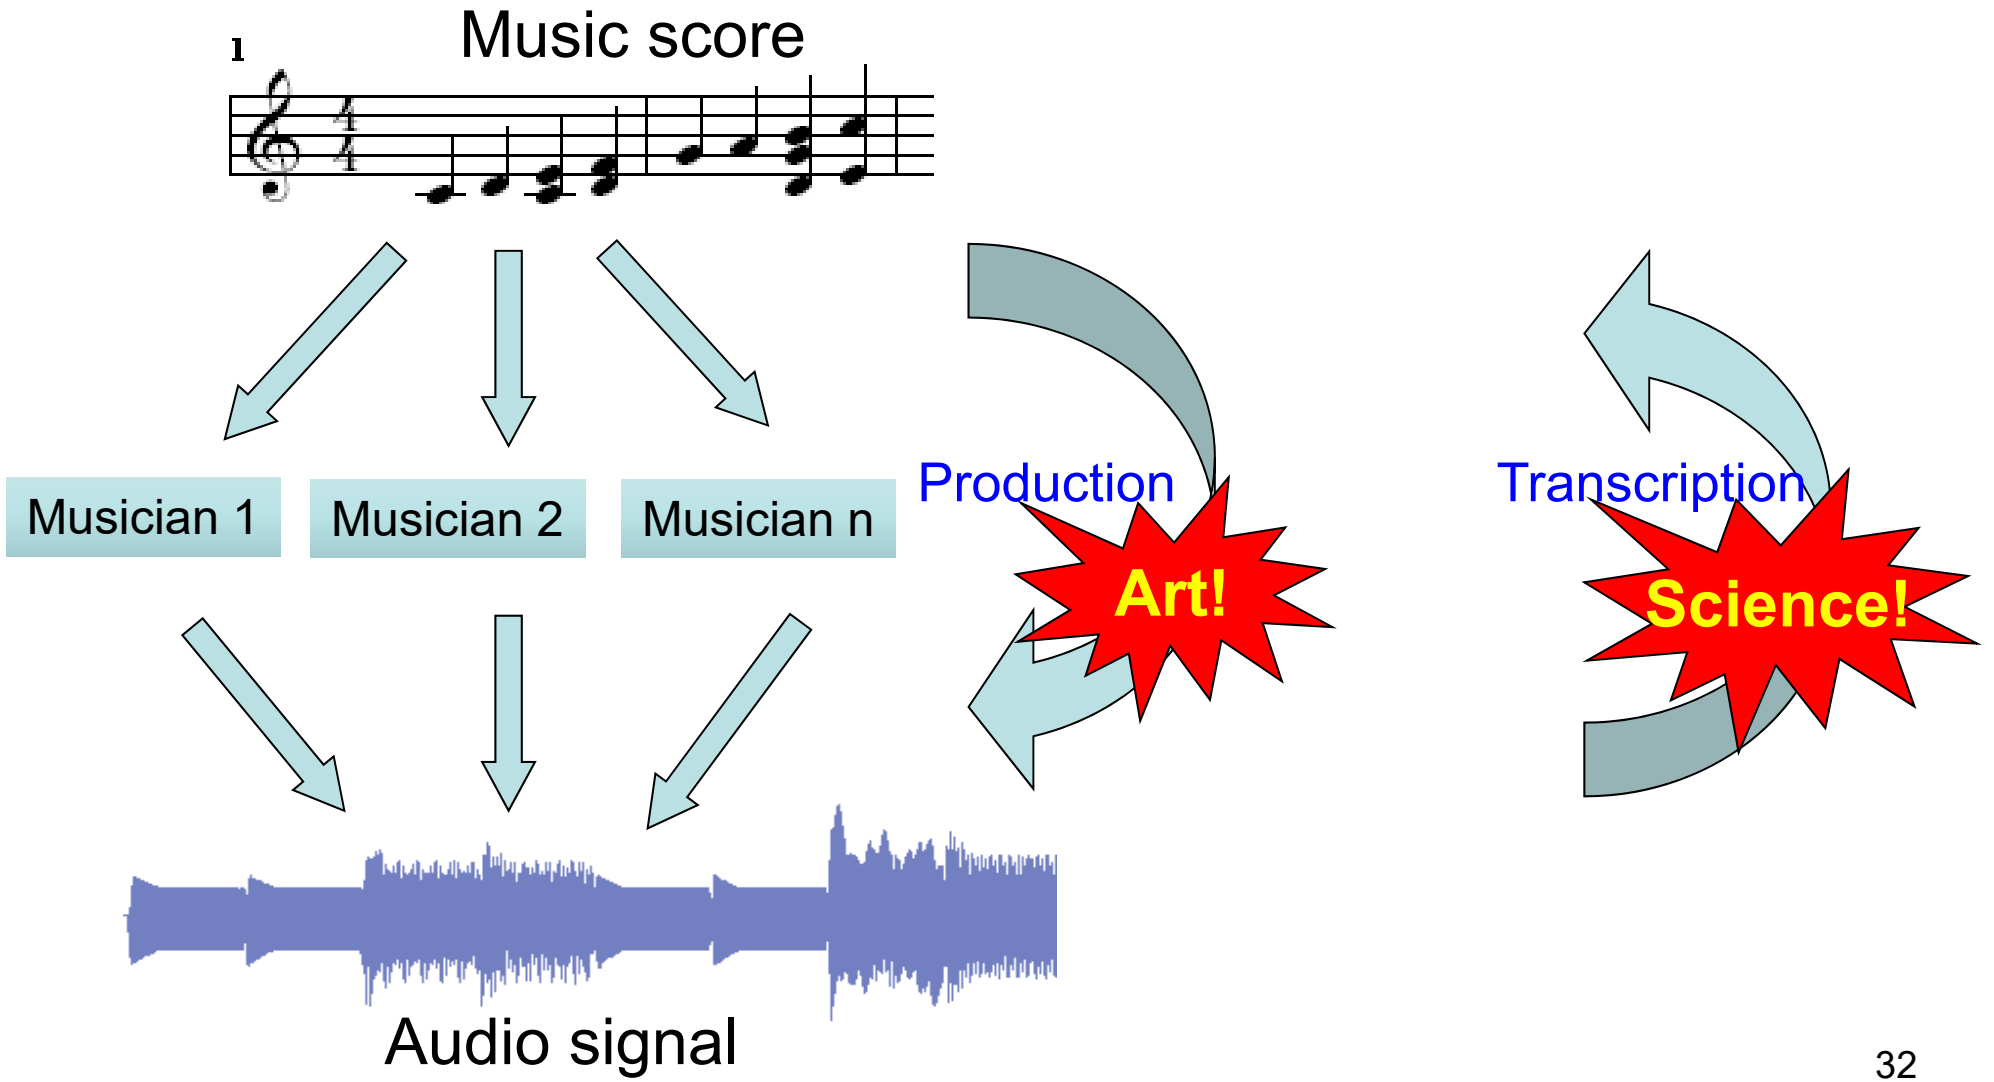
- Free software: GarageBand, Anvil Studio, …
- Python libraries: mido, pretty-midi, …

- Inconsistent sound effects
- No vocals
- Less realistic

Today's topics

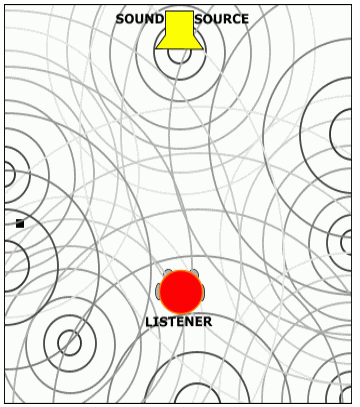
1) Recall what we have learnt last week
2) Music representations – music notation demystified
3) Music analysis (e.g. transcription)

Music Production and Transcription



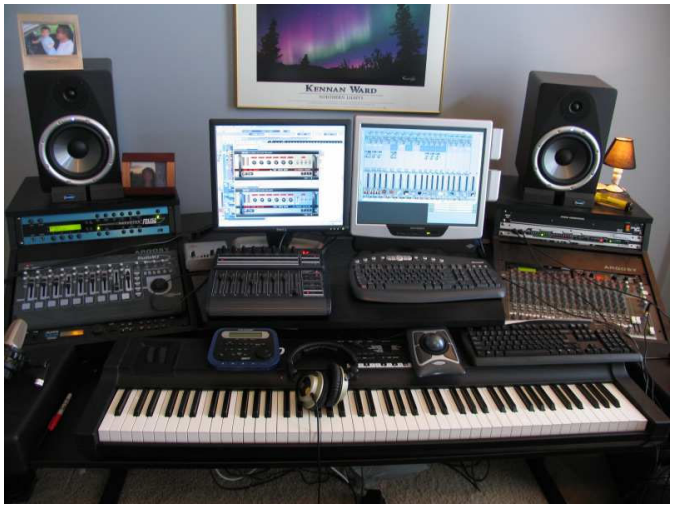
Acoustics

- Reverberation (echo) is caused by reflected waves
  - exaggerated in enclosed rooms
  - amount depends on material, room size

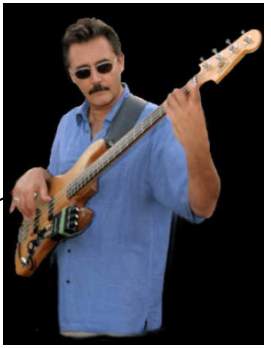


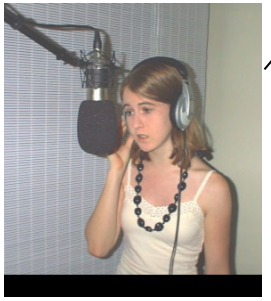
- Recording studios typically have little reverb
  - Acoustically treated walls absorb / diffuse sounds.

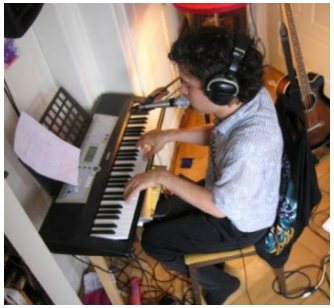
Recording



- Studio Engineer





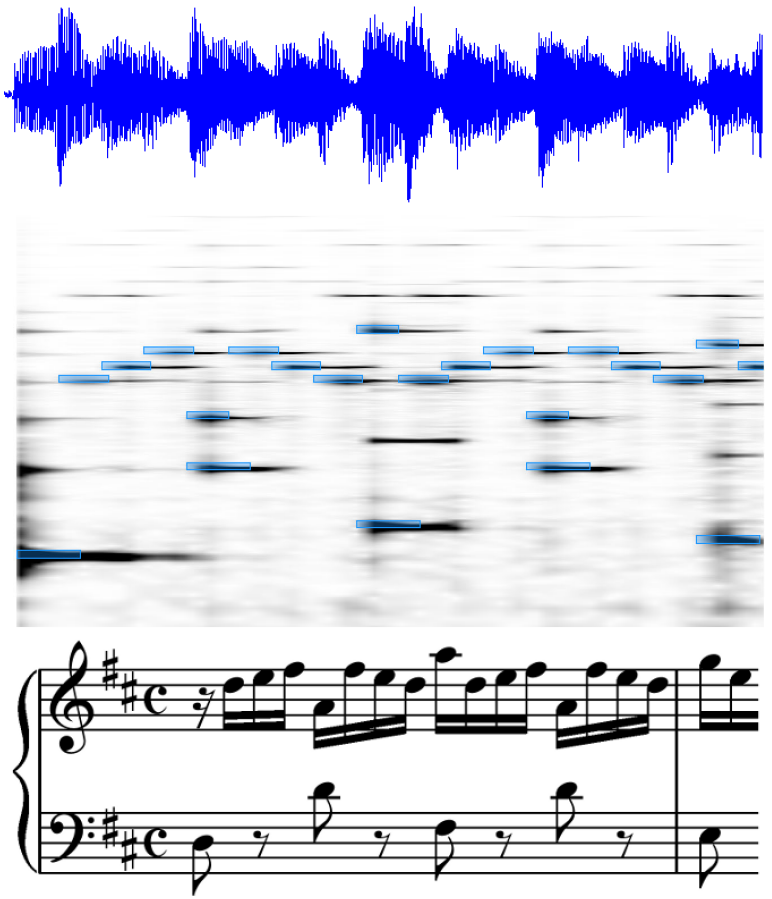


Mixing

- Balance the relative volume, frequency, and dynamical content of a number of sound sources
  - Drums 
  - Bass 
  - Guitar 1 
  - Guitar 2 
  - Vocals 
  - End product 
- Usually, digital WAVE files in 24-bit, 44.1kHz or higher

Automatic Music Transcription (AMT)

Automatic music transcription (AMT): the process of converting an acoustic musical signal into some form of music notation (e.g. staff notation, MIDI file, piano-roll,…)



Fundamental (and open) problem in music information research

Applications:

- Search/annotation of musical information
- Interactive music systems
- Music education
- Music production
- Digital/computational musicology

In comparison to ASR, the progress of AMT is quite limited. Why?

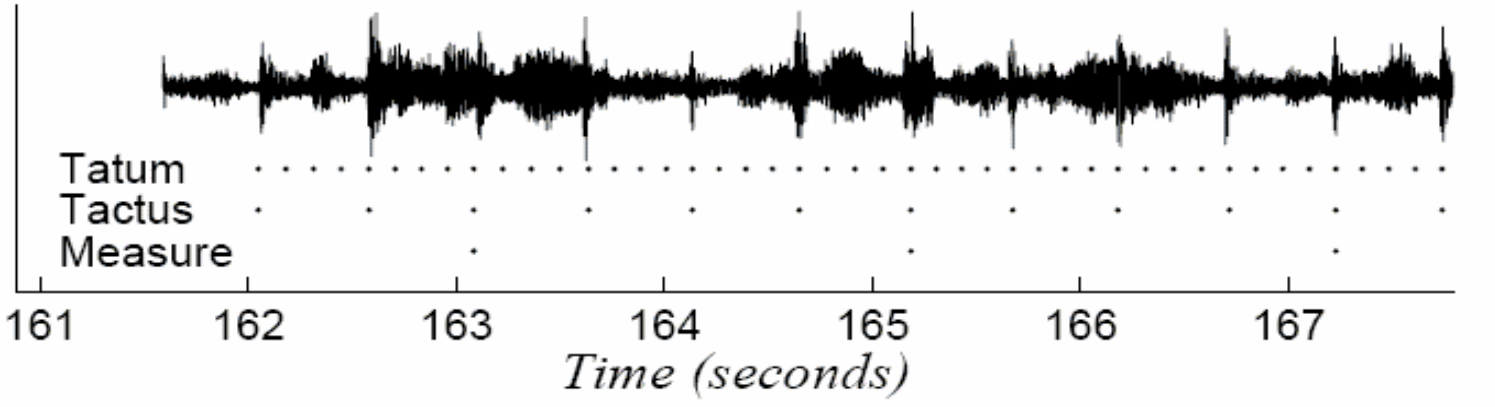
Music Transcription: What to transcribe?

Musical Terminology	Matching Physical property
 Duration/Onsets	Time measured in samples
 Pitch	Fundamental Frequency F0
 Loudness	Logarithmic scale (simplifies)
 Timbre/Tone Color	Difficult, no single physical attribute describes it completely

- Vibrato and other expressive features
- Lyrics

Temporal Structure

- Goal is to **automatically find musically relevant time information** (e.g. start of single notes) in the recorded signal



Temporal Structure

Examples:

Percussive sources:

Drums, Cymbals; rather simple to find by looking at signal energy

Harmonic sources:

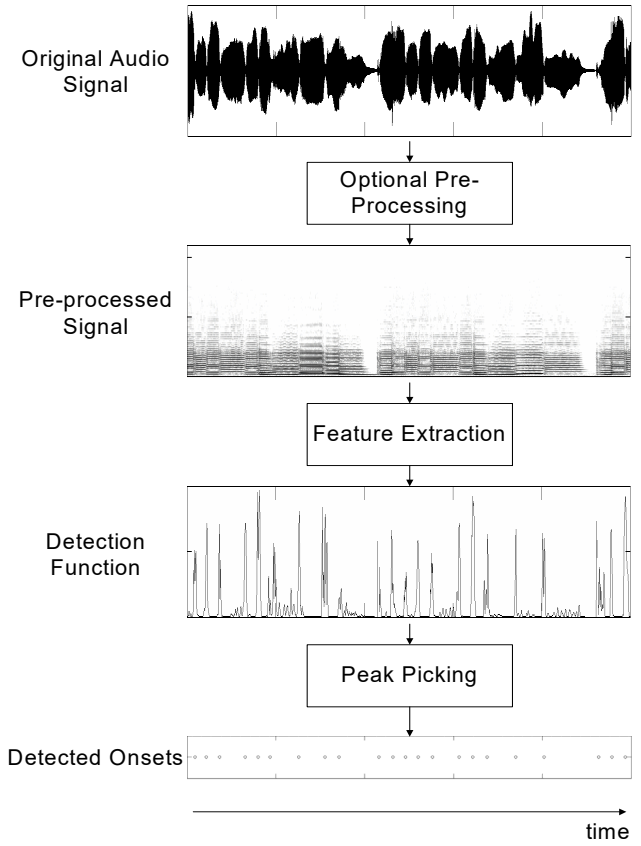
Singing voice, violin, trumpet; much harder to derive temporal structure from harmonic changes in signal

Conclusion:
We need more sophisticated methods for harmonic signals

Temporal Structure

A typical signal processing scenario of an onset detection system

Key is to find numerical methods which allow for reliable peak picking



Temporal Structure

Examples of automatically derived time information:

- **High-frequency tick** (claves) indicates tatum pulse (**note level**)
- **"Side stick"** (snare) indicates the tactus pulse (**beat level** or foot tap)
- **Bass drum** indicates the measure pulse (**musical measure**)

Source: http://www.cs.tut.fi/~klap/iiro/meter/index.html

Pitch and harmonic structure

Pitch:

- perceptual attribute, allowing ordering of sounds on a frequency-related scale from low to high
- Defined as the frequency of a sine wave that is matched to the perceived sound by a human listener

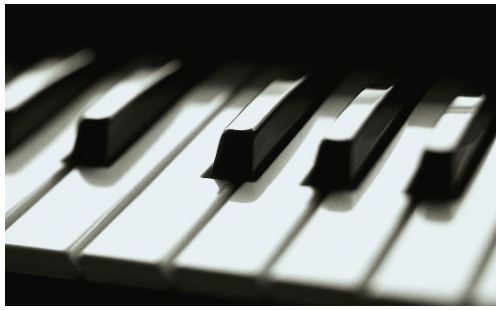
Fundamental frequency:

- Is the corresponding physical term
- Only defined for periodic or nearly periodic musical signals

Commonly used pitch detection algorithms include YIN and pYIN.

Pitch and harmonic structure

- Musical Scale
  - A3=220 Hz
  - Exponentially Stepped $A3 * 2^{1/12} = 233$
  - Semitone Step= $\sqrt[12]{2}$
  - Octave Step= 2 (A3 -> A4; 220 Hz -> 440 Hz)



Semitone

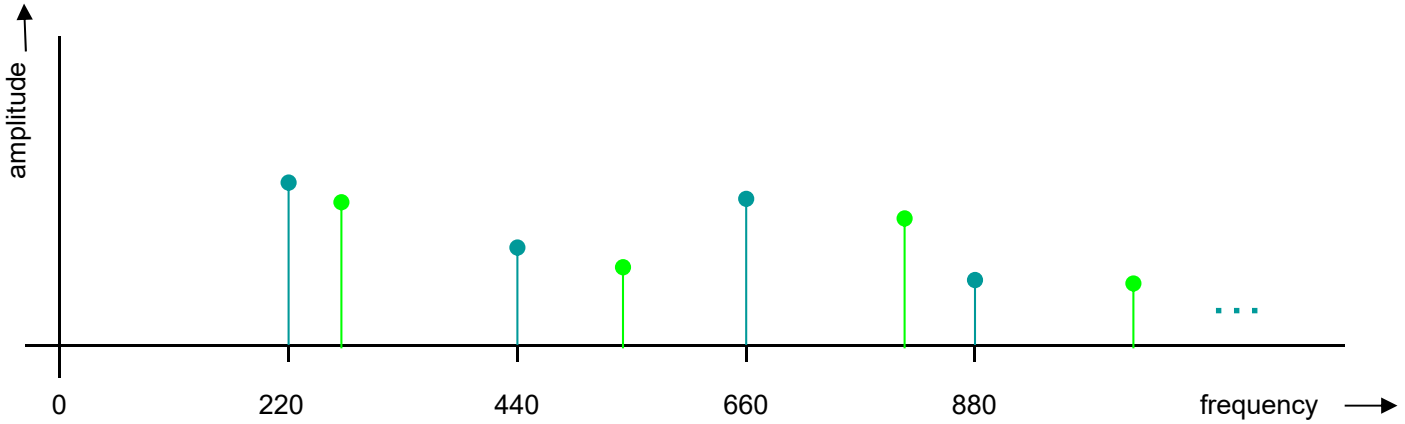
Note	Freq (Hz)	Note	Freq (Hz)
A3	$A3 * 2^{0/12} = 220$	C#4	$A3 * 2^{4/12} = 277$
A#3	$A3 * 2^{1/12} = 233$	D4	$A3 * 2^{5/12} = 294$
B3	$A3 * 2^{2/12} = 247$	D#4	$A3 * 2^{12/12} = 440$
C4	$A3 * 2^{3/12} = 262$	E4	$A3 * 2^{24/12} = 880$

The musical scale approximates the critical bandwidth in our ear!

Pitch and harmonic structure

A challenging problem: multi-pitch detection (polyphonic sound)

Example: A3 (220 Hz) and C4 (262 Hz)



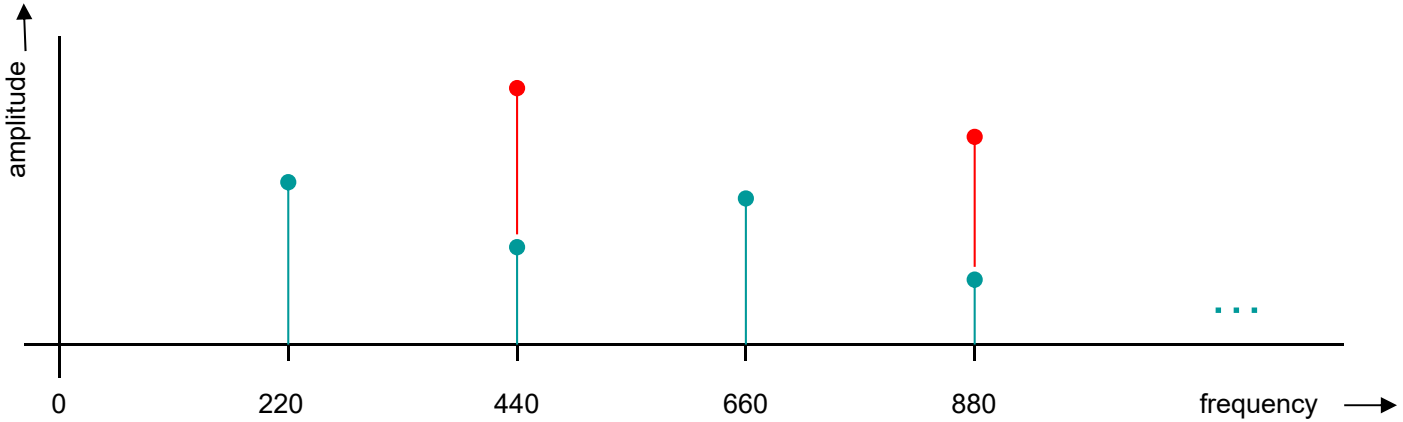
Relation to audio source separation task!

Demystify the cocktail party effect!

Pitch and harmonic structure

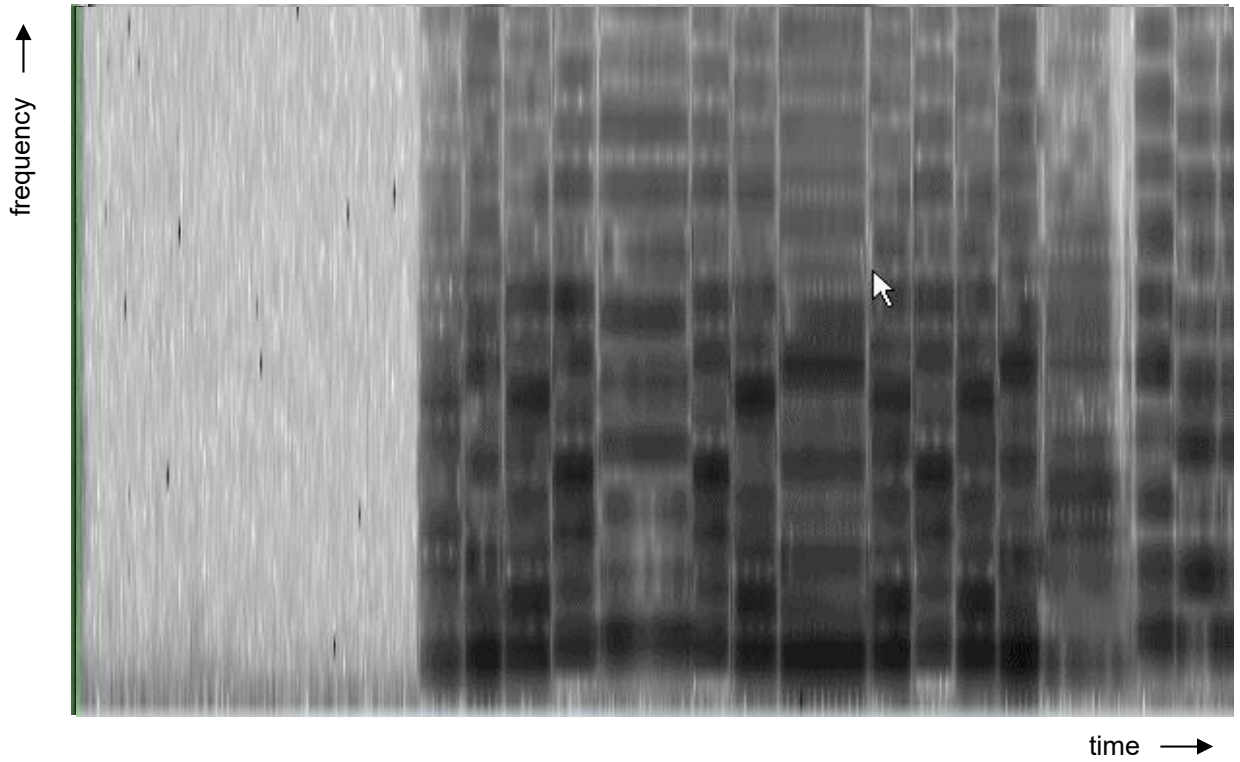
A challenging problem: multi-pitch detection (polyphonic sound)

Problem: A3 (220 Hz) and A4 (440 Hz)
The harmonics overlap and such it is very difficult to separate the two tones



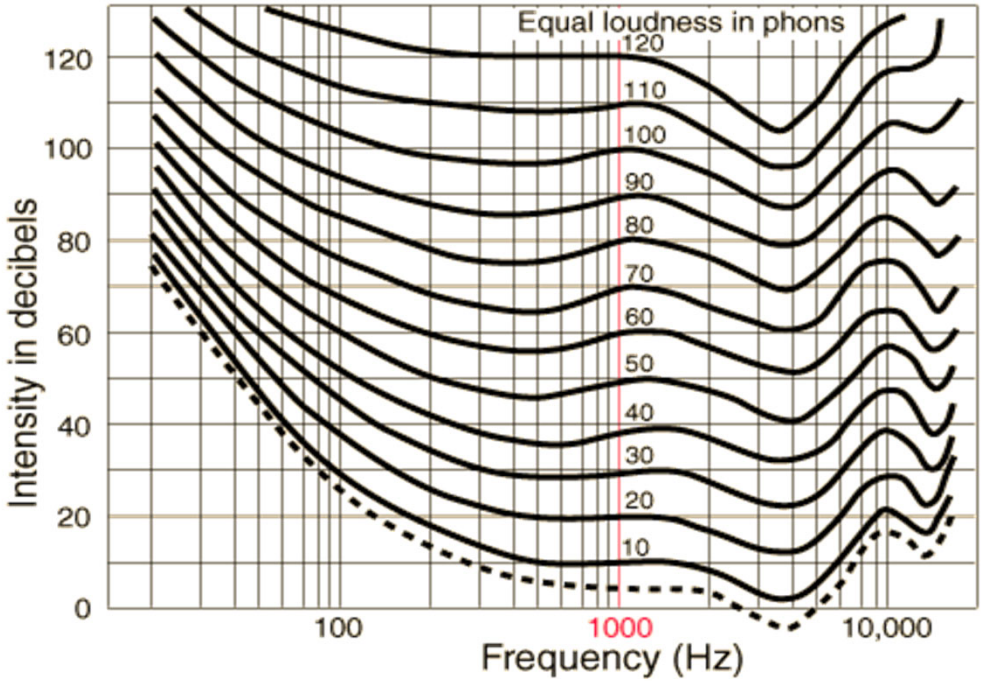
Pitch and harmonic structure

One major problem of the FFT is the Heisenberg-uncertainty



Loudness

- Perceived loudness has no-trivial connection to its physical properties
- Models exist, to computationally simulate the perceived loudness, based on psychoacoustics
- In music processing things are **simplified** by using a logarithmic scale



Timbre

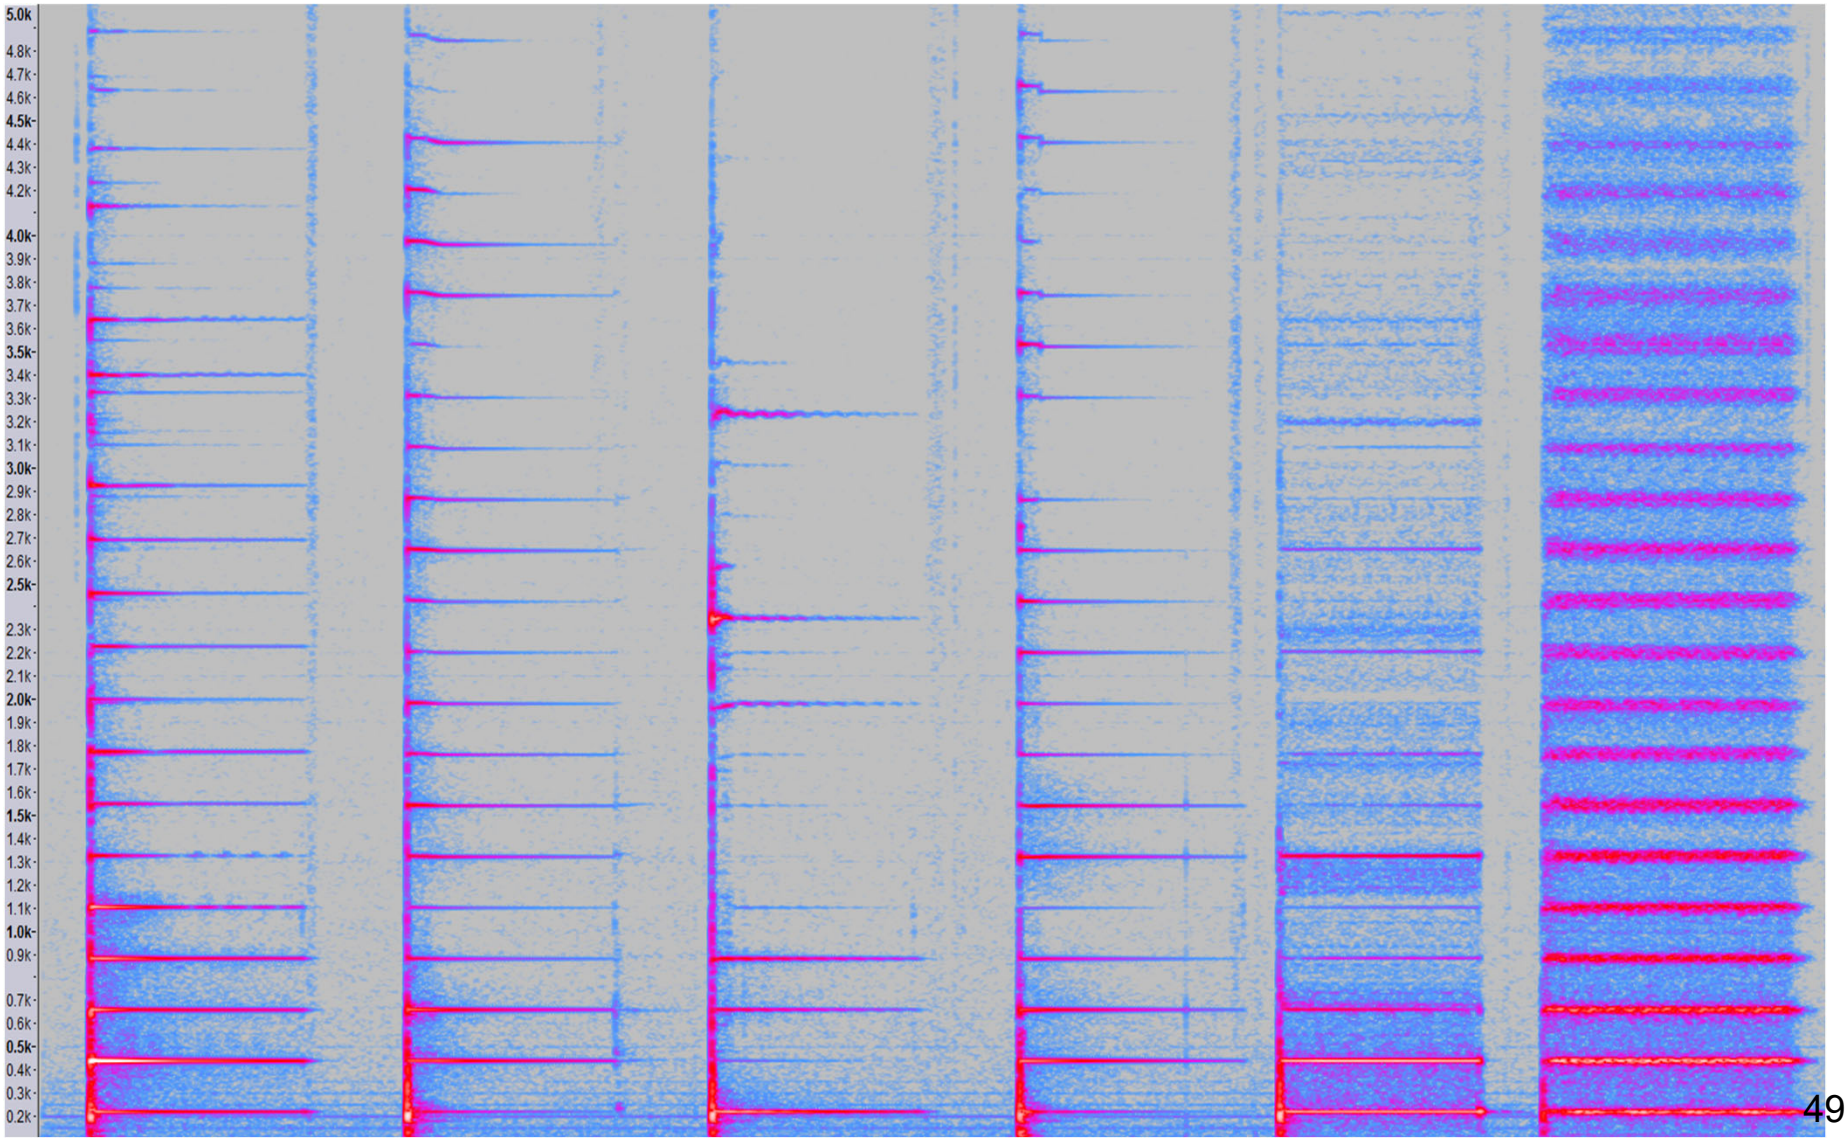
Timbre is difficult to describe and analyze, but is an active research problem

- Timbre is what distinguishes the sounds of different instruments playing the same note

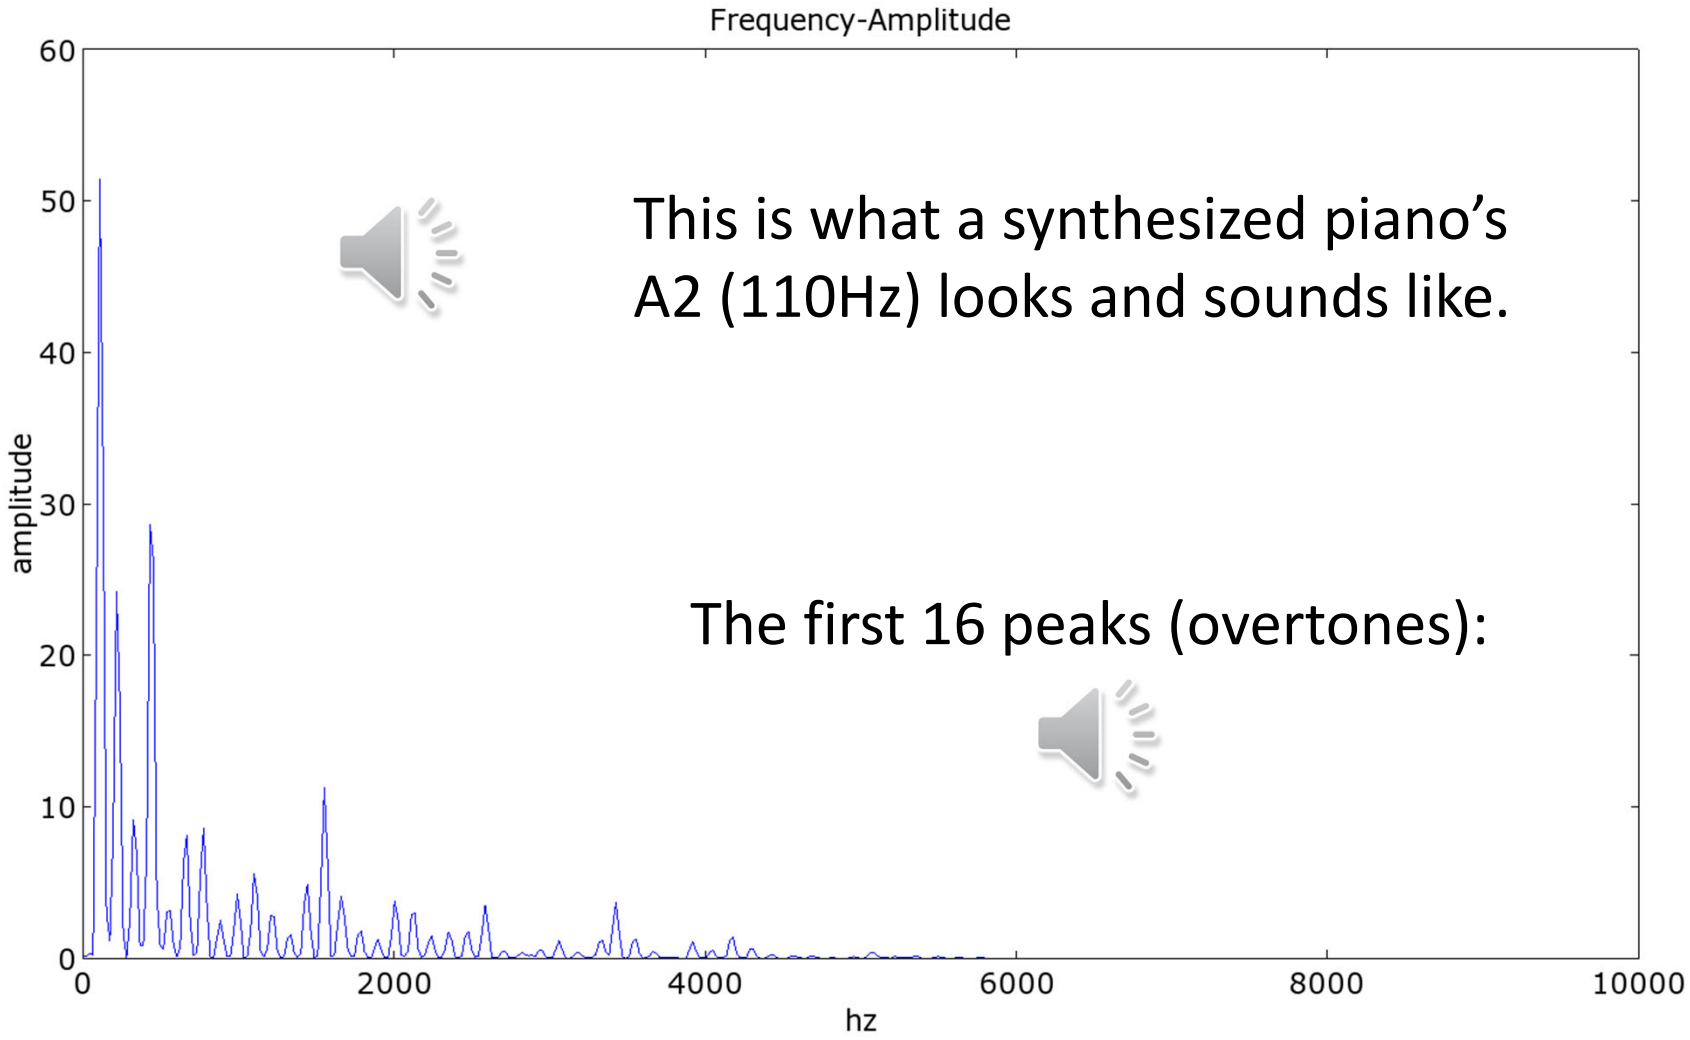
- 3 things to keep in mind about timbre:
  - The same instrument has many timbres
  - It's not just a snapshot of the spectral envelope but depends on temporal variables such as decay
  - It is intricately linked to speech analysis (*e.g., my voice quality changes during the lecture*)

Timbre

piano harpsichord vibraphone guitar organ string orch.



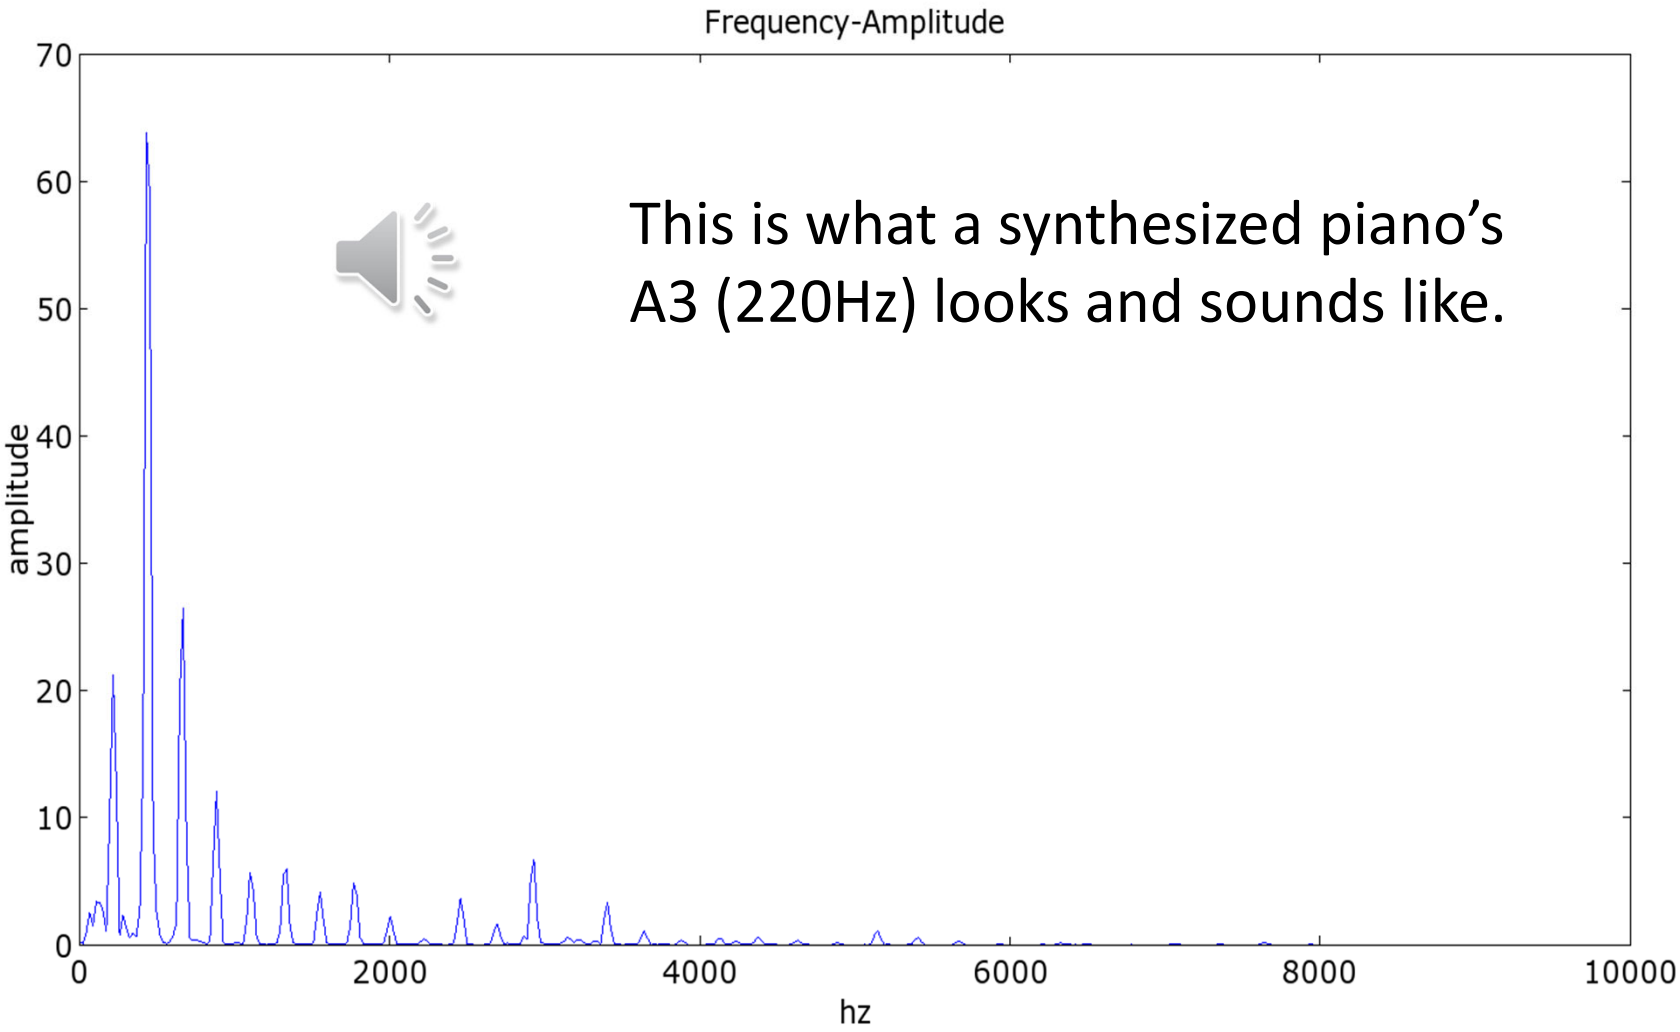
One Piano, Many Timbres



This is what a synthesized piano's A2 (110Hz) looks and sounds like.

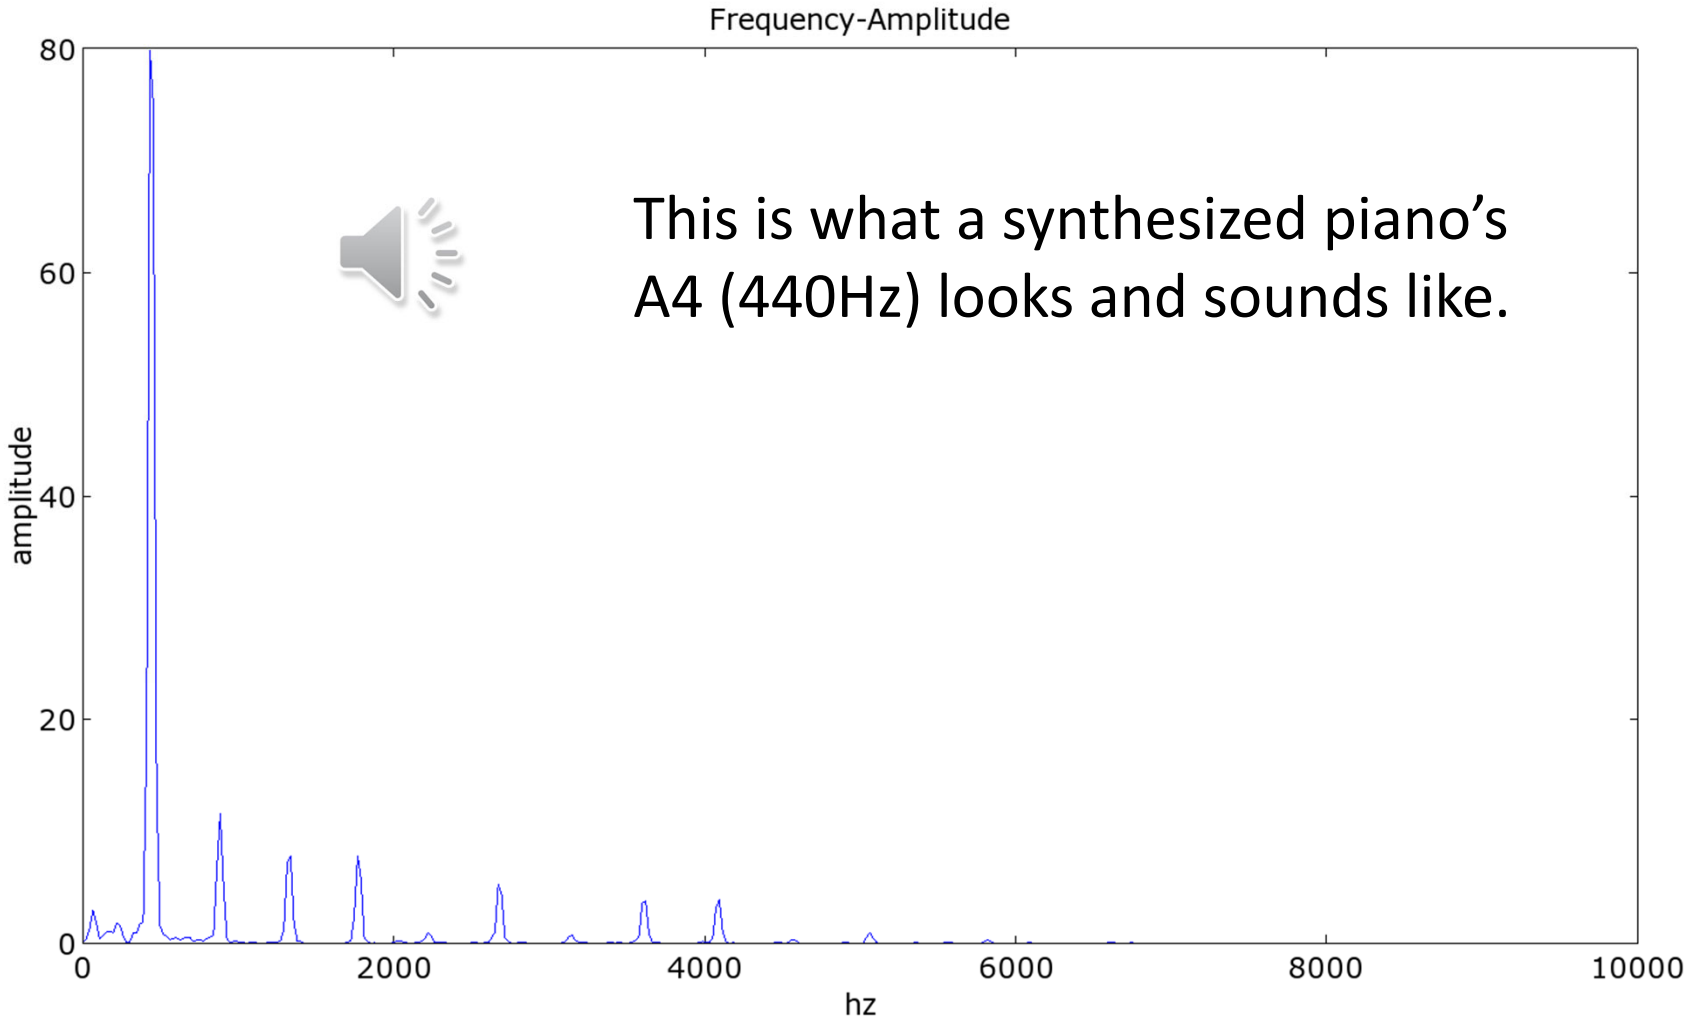
The first 16 peaks (overtones):

One Piano, Many Timbres



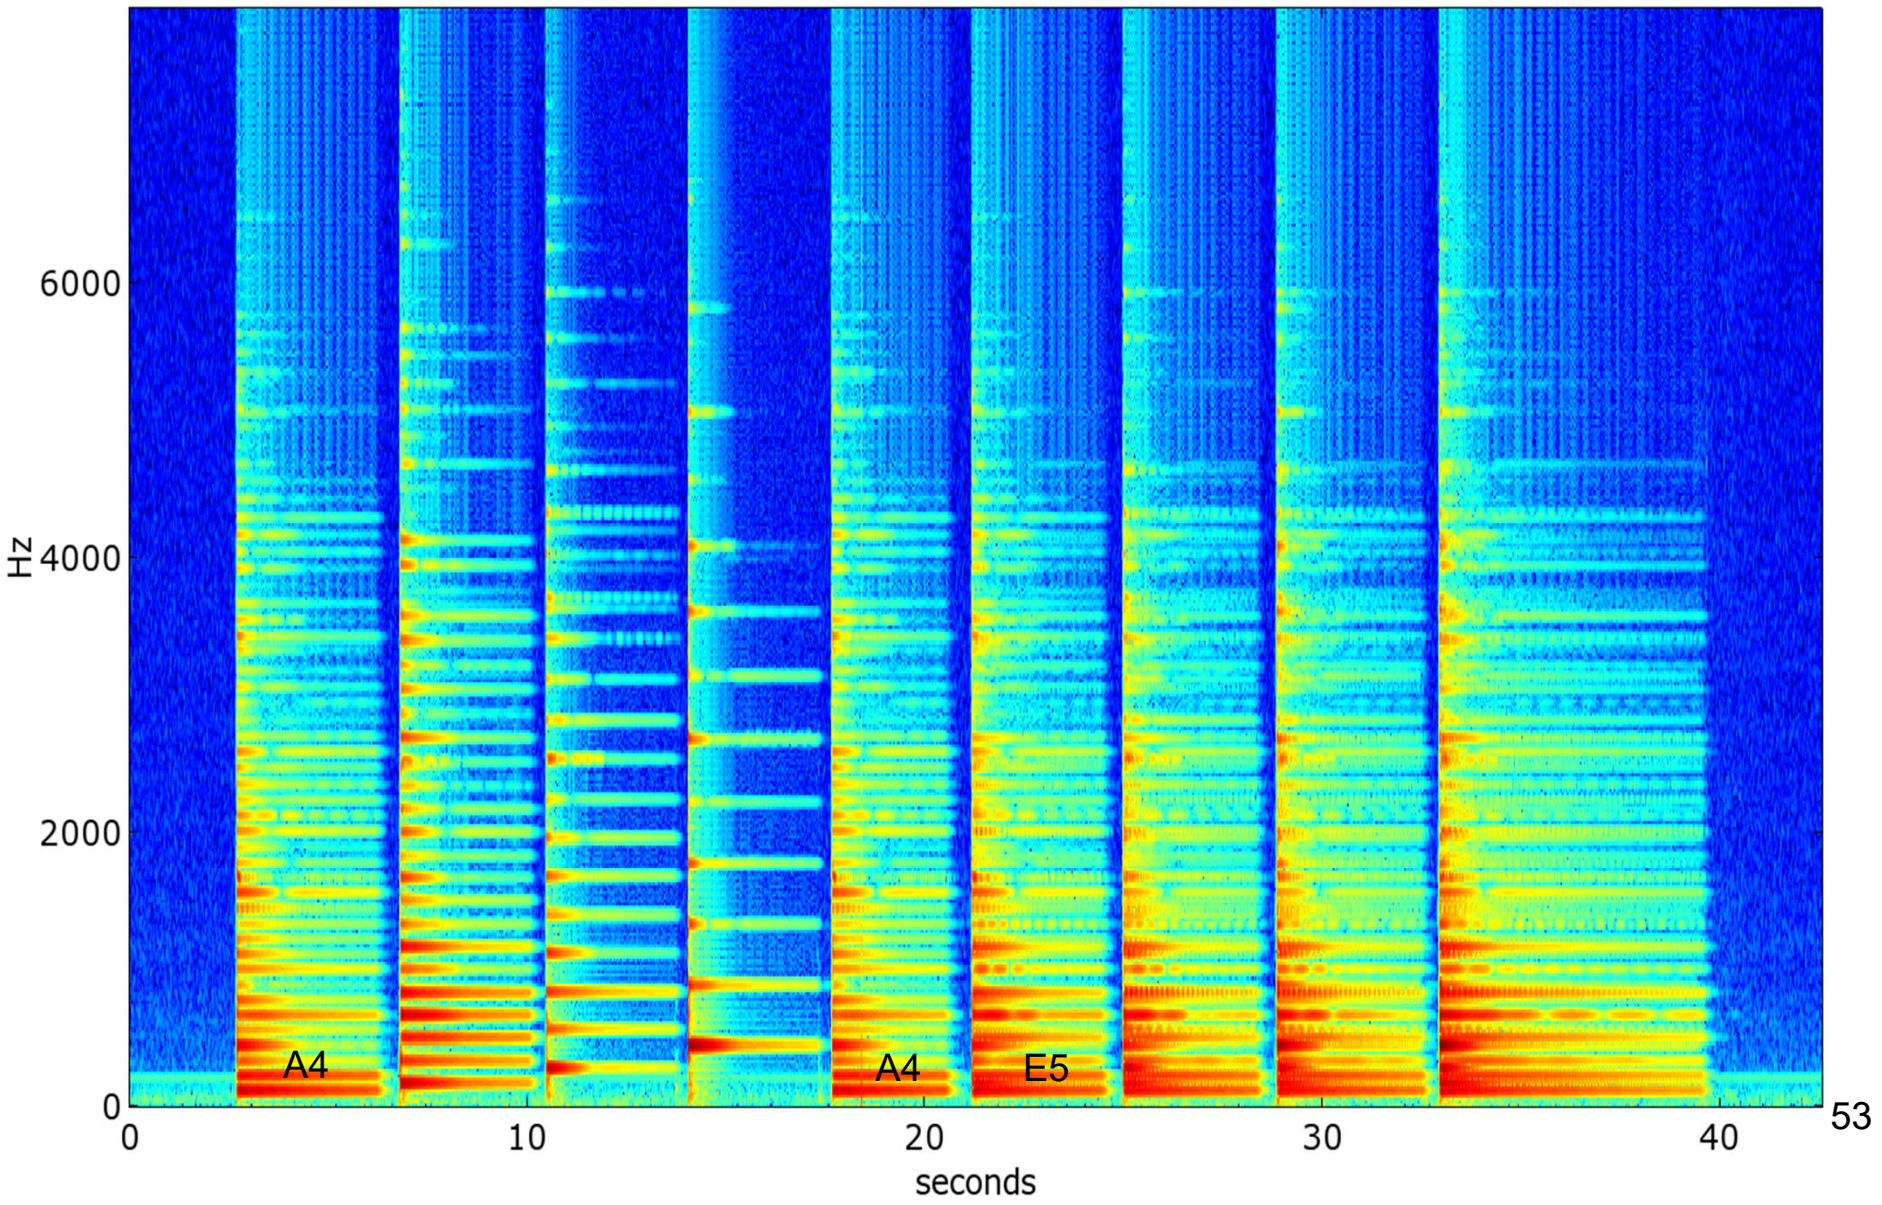
This is what a synthesized piano's A3 (220Hz) looks and sounds like.

One Piano, Many Timbres

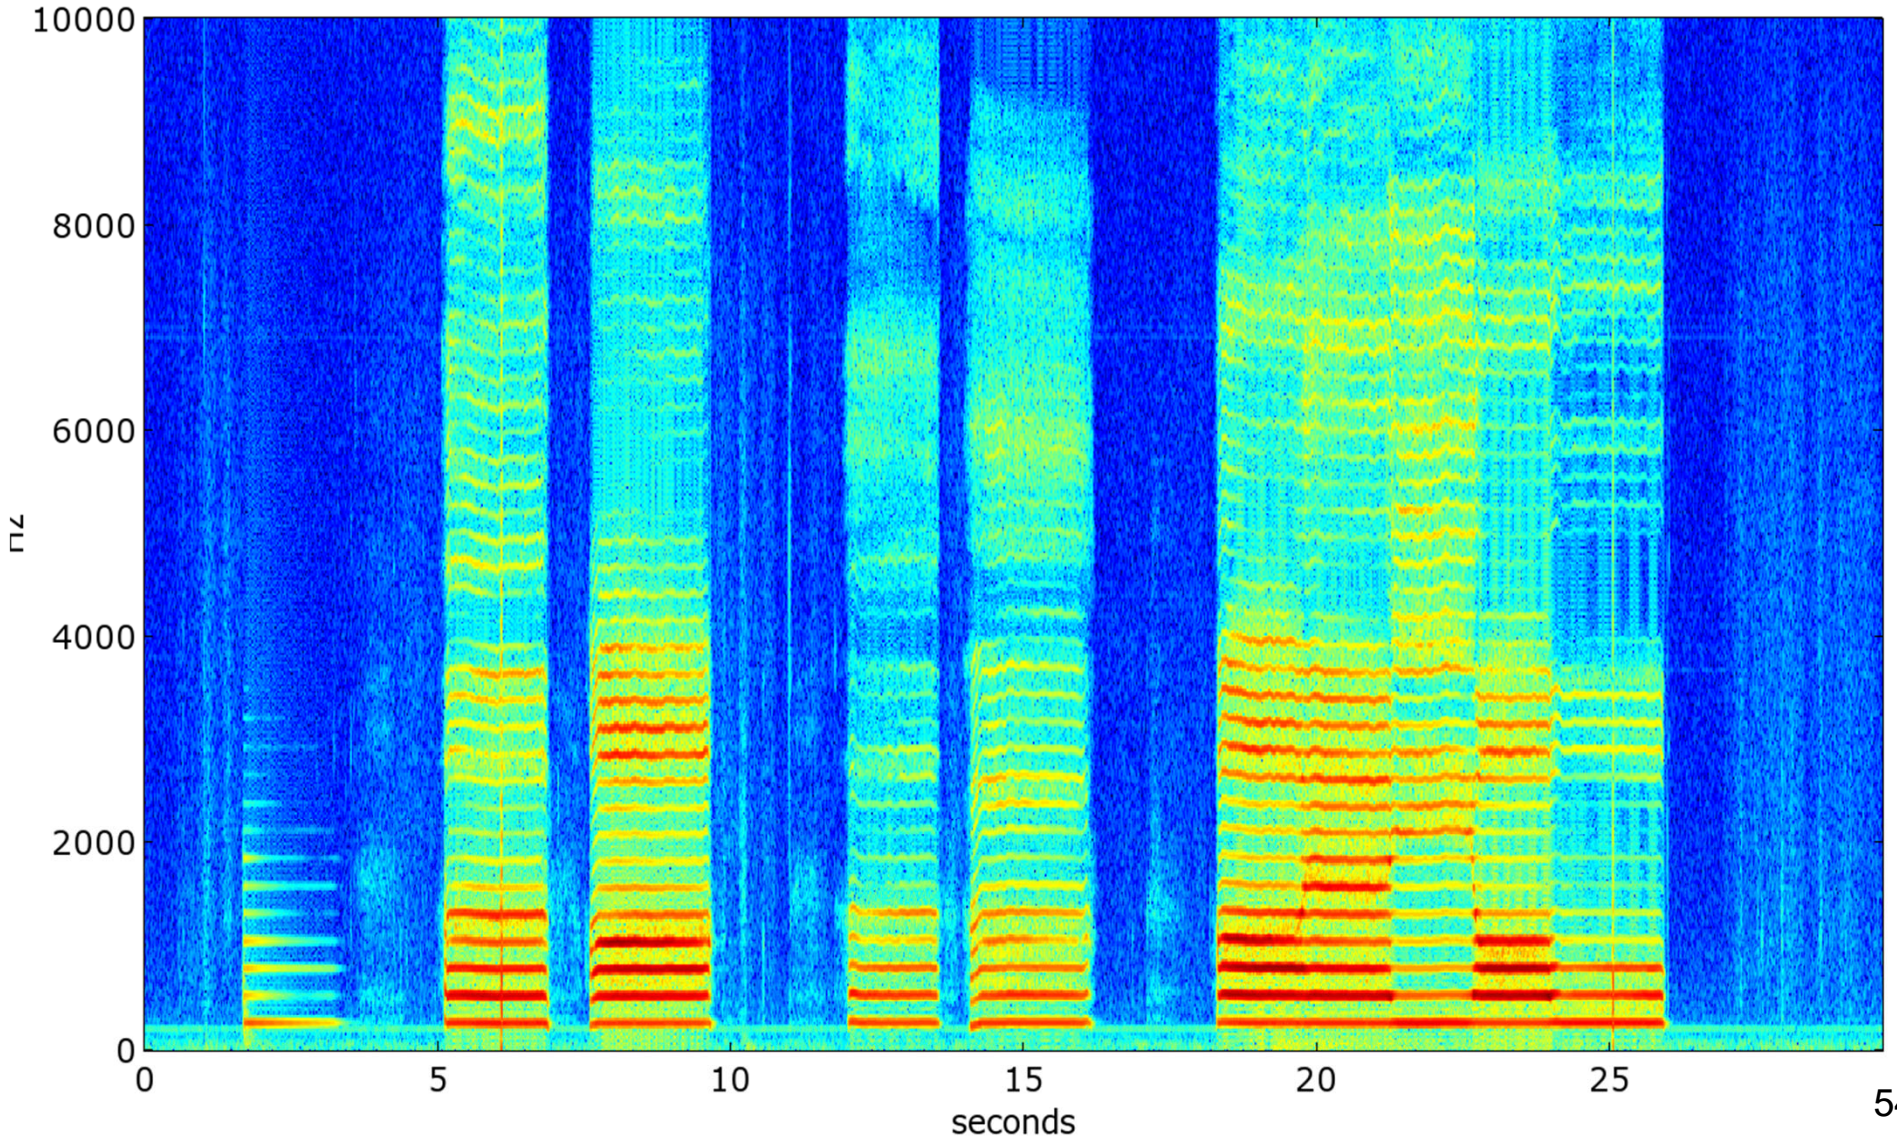


This is what a synthesized piano's A4 (440Hz) looks and sounds like.

Decays



Speech: Voices & Vowels



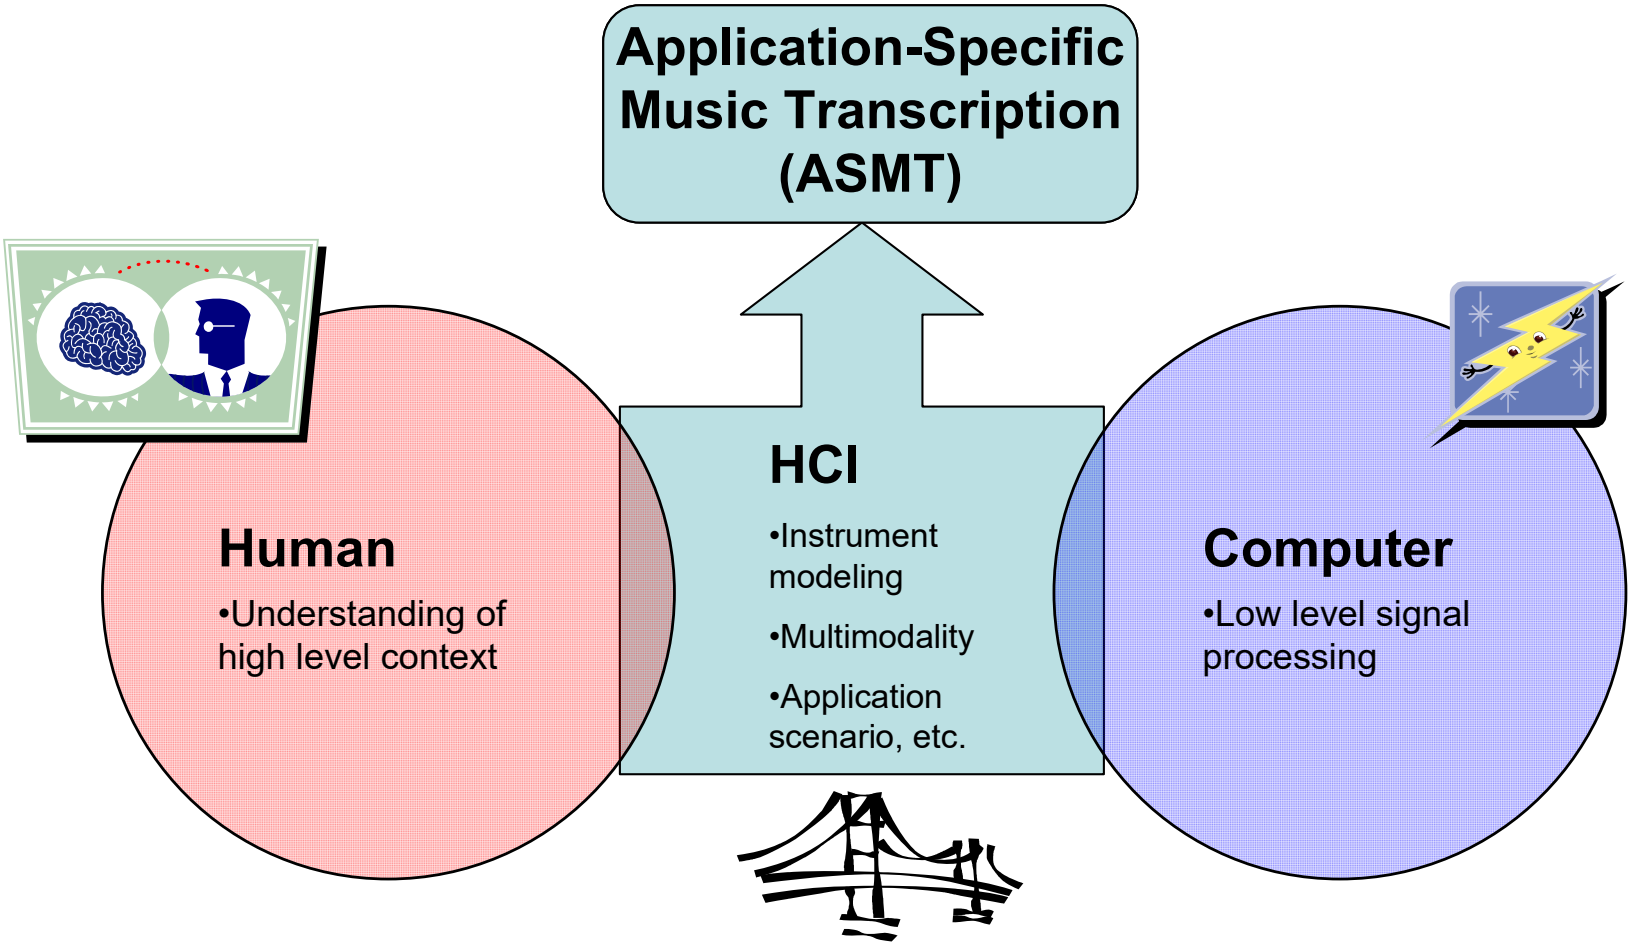
How do we process timbre?

- Each genre has its own “sounds”
- The “sound” is in large part created by the instrumentation of the piece of music
- Despite the complexity of the audio signal and the variability within an instrument, the brain can parse out each instrument, each voice.
- Machine has quite a long way to go

State-of-the-Art and Future Directions

- HCI to leverage strengths from both human and computer
- Multimedia fusion to improve transcription performance
- Instrument model to improve transcription performance
- State-of-the-Art results

How could we address the AMT challenges?



Ye Wang & Bingjun Zhang, “Application-Specific Music Transcription for Tutoring”, IEEE Multimedia, Vo.15, No.3, July-September 2008

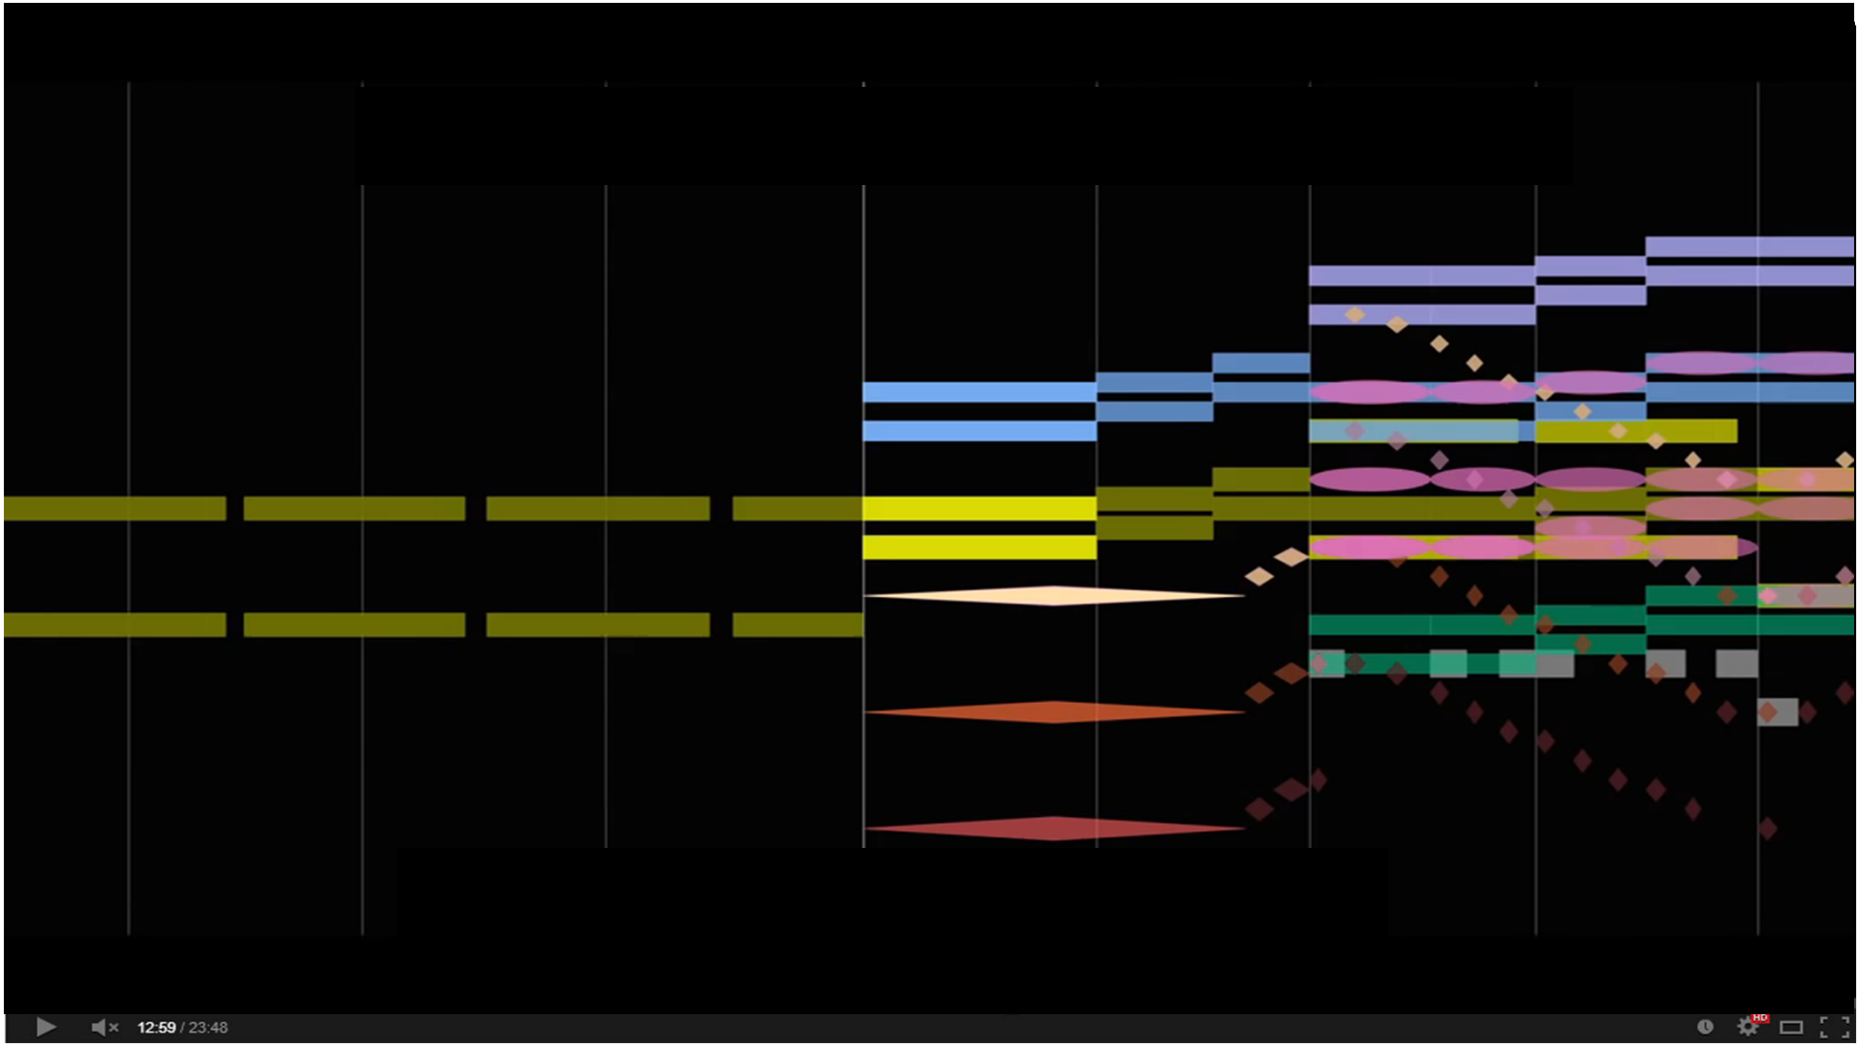
What's in the music?

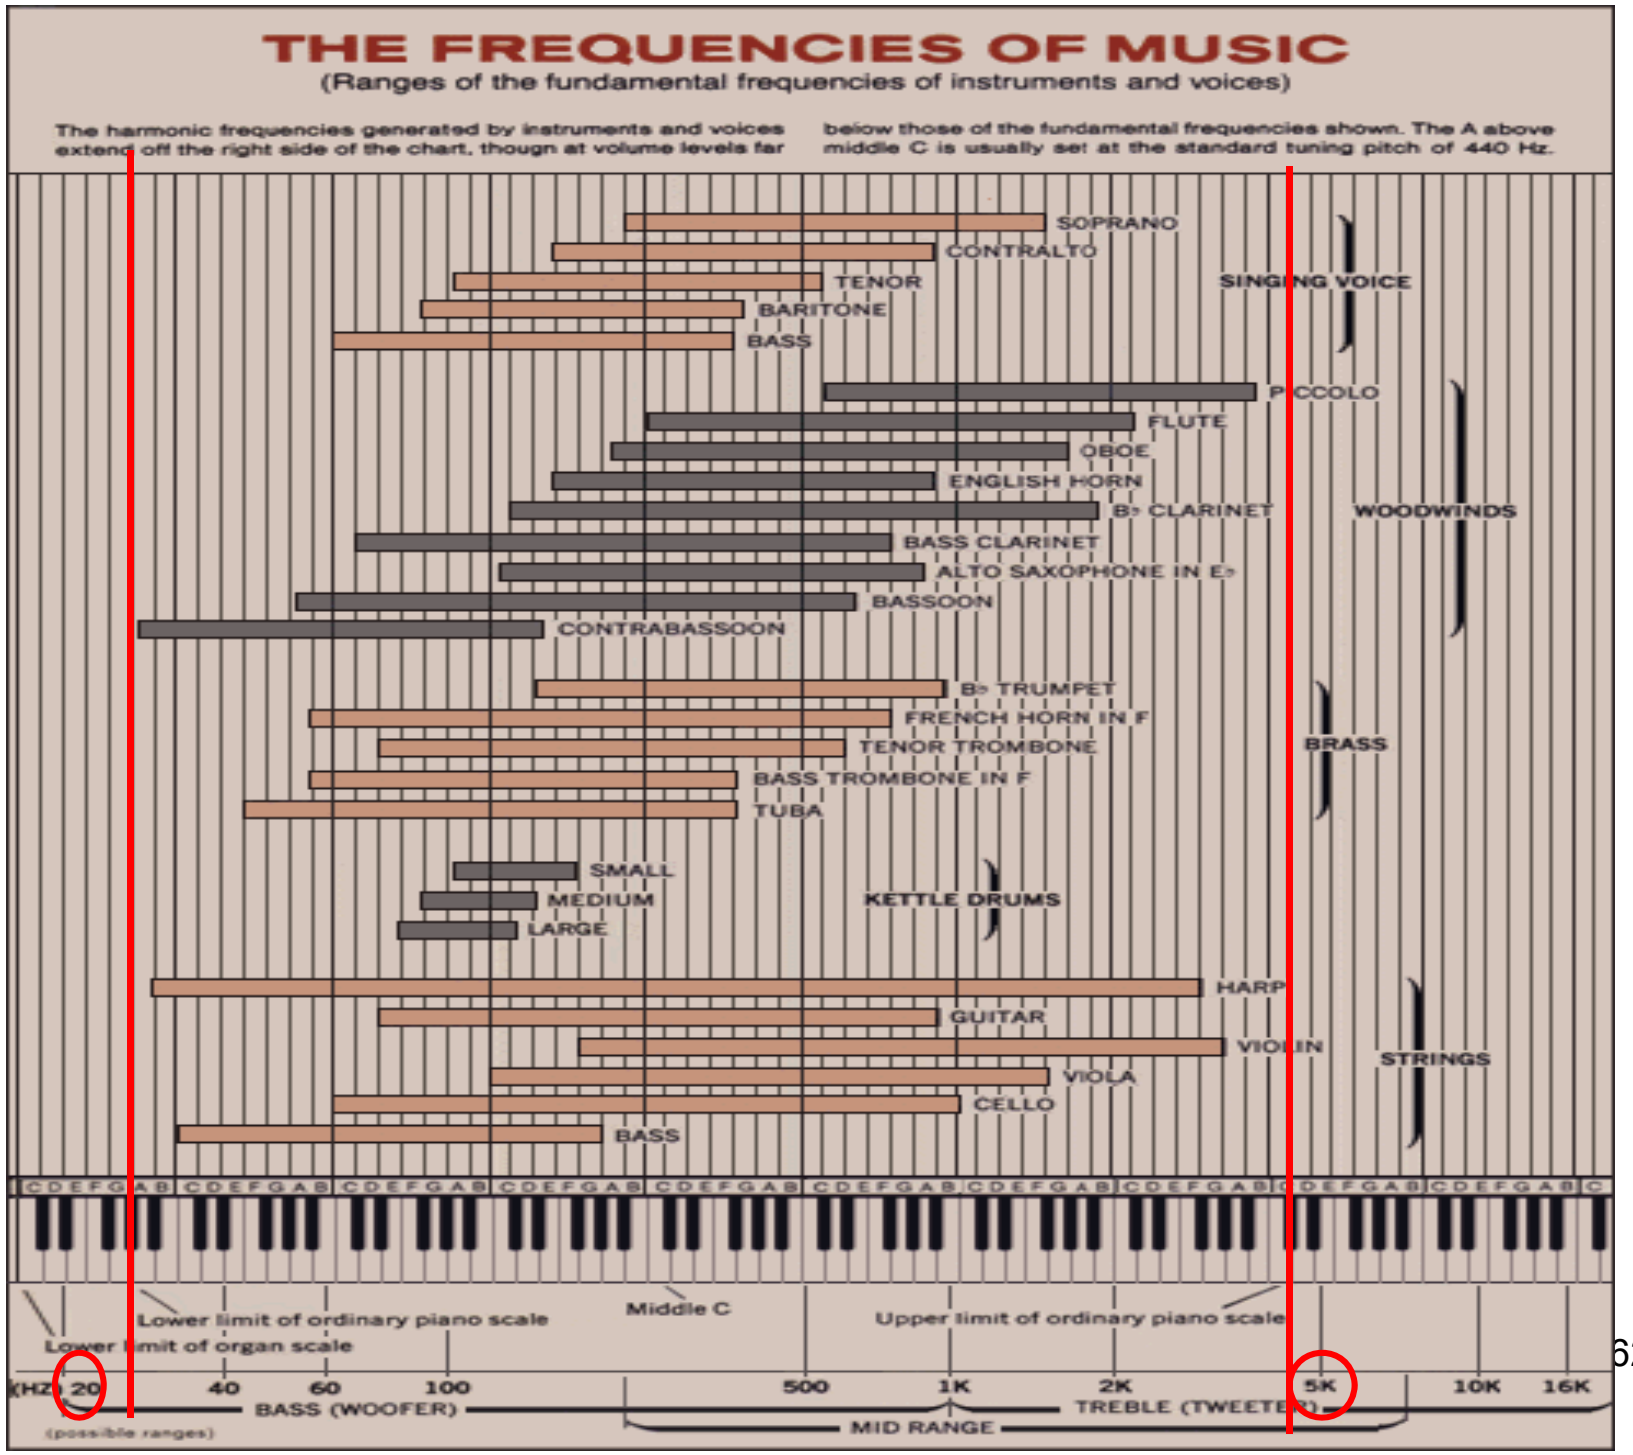
Ode to Joy from Beethoven's 9th Symphony, view 2



http://www.youtube.com/watch?v=ljGMhDSSGFU&t=12m55s

Performance was recorded and stored in MIDI format, which easily visualizes.

Can we one day do so directly from wav/mp3 format?



THE FREQUENCIES OF MUSIC
(Ranges of the fundamental frequencies of instruments and voices)
The harmonic frequencies generated by instruments and voices extend off the right side of the chart, though at volume levels far below those of the fundamental frequencies shown. The A above middle C is usually set at the standard tuning pitch of 440 Hz.

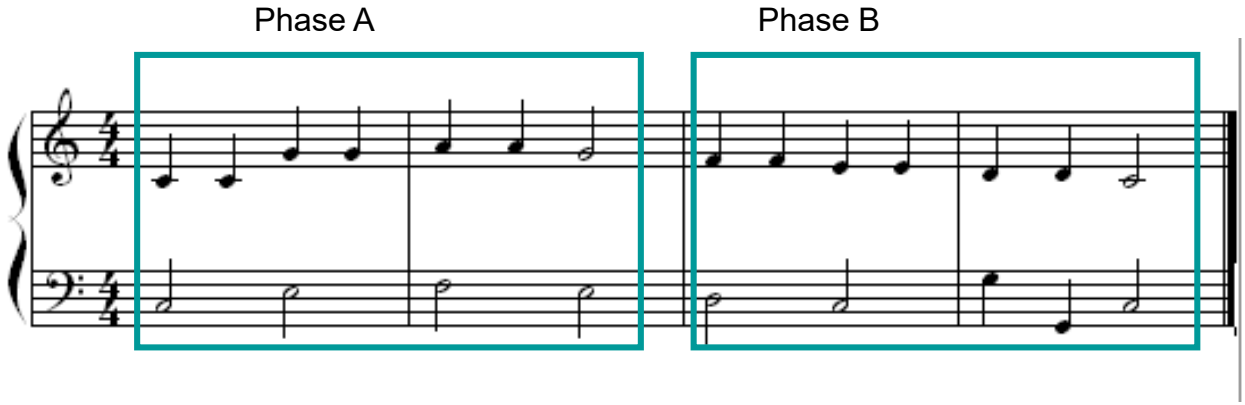
What else did we miss out?

- Phrases, Sentences, Paragraphs
  - The way words are grouped together to make phrases, sentences and paragraphs is paralleled in music
  - Phrases are grouped together to form musical sentences, sentences grouped together to form musical paragraphs.
  - Eventually leading to musical Form



Twinkle Twinkle Little Star is of the form A-B-C-C-A-B

Challenge: Global structure of music beyond the low level structures of notes, rhythms
Simple case: Verses, Chorus of a pop music

Summary of Today's Lecture

1) Recap what we have learnt last week
2) Music representations – music notation demystified
3) Music analysis (e.g. transcription)

A few words about the group project

Multimodal presentation of music

Expressive visualization of music
